I am already way ahead of you here, as this is what I have been doing for over a year. After using a 520ST for nearly 18months for the internet, I started finding 520ST&1040ST second hand for cheap or free. Last purchase was a Mega2ST for $20.Cdn. About $12US. However I have been doing things with the older hardware and really want to adapt these Becroft devices. Since I am quite used to the bugs when using early TOS and internet, I have been giving the machines for COST to FREE, depending on what I have into them, as cheap internet computers for some people less fortunate than me.

Of course, you can find 486s and such for Roughly $50. I simply can't help out the users, so they are stuck with what I know. Besides that I can find cheap printers and supply all the other software needed. I have hundreds upon hundreds of commercially boxed software.

Even still, with the ease of use and manuals I find that helping others takes up a considerable amount of time. But as I used to run an Atari ST club in the 80s I am used to peoples questions. The only stipulation I put on the computers is that if the people find themselves not using it or getting something else, that I get the computers back for others.

Now as OLD Macs are getting to be very cheap, these may also be a viable alternative with iCAB.

Question for anyone that can answer? Can MAGICMAC run ST INTERNET software such as STING and CAB.

Regardless, there are alot of things the ST can do other than Midi. The CyberSeries although incredibly dated, can still allow alot of creativity.

>This, coupled with any second-hand 28.8 or 33.6 modem, produces a
>rather good machine for music sequencing and the occasional email
>to the freenet using Newsie.

The above set up is good for NEWsie, but is also quite acceptable for CAB with Graphics off. This is actually pretty fast and if the WEB PAGE is GOOD enough, (You turn the graphics on and WAIT;-).
(Don't bother waiting for the QFUNK PAGE, YAWN:-) But you still get the page, and all the files. You can even use CAB in Lowres with a resource program that allows the entire menu in CAB to be available. This provides 16colour graphics (Equal to my STock TT). However I tend to use the program in HI RES and get the graphics downloaded then view them in Speed of Light ect. and appreciate the pictures even more.

Now a few things that I have noticed is that early versions of NEWsie work better with the older TOS. Particularly anything btw .86 and .90. Older TOS being TOS 1.0 to 1.2. Clearly and IDE adapter with TOS 2.6 would clear up alot. However if you have memory to spare 2.5 meg or more, then MAGIC is a good solution to the TOS problems.

I am using a Falcon STOCK at this moment and I can tell you that the speed at 28800 isn't much faster than the ST at 19200.

I just happen to be enjoying the Falcon Alot at the moment:-).

The question for the ST is how much do all these mods cost,

1)IDE
2)TOS 2.6
3)Ram + card
4)HD Floppy Upgrade (Drives can be found for FREE).
5)Serial Port Upgrade.

Finally I would like to add alittle more speed to the ST, heck even the Falcon and the TT for that matter:-).

While I enjoy messing with the ST, I think you will find that adding a number of the above upgrades costs alittle more money than you might expect if you want to give these machines away to people.

Therefore while the upgrades are all advisable, I have worked pretty much with STock STs and whatever ram they have available. I haven't tried the NEWER versions of STing with them as I have seen little need to upgade from Peters last release.

Later Brian.

10 inches? Hmmm, heres what I think...

Size is irrelevant...don't you know women judge length poorly?

Long Dong Silver (a porn star) has almost double that at 18",
but fails to 'raise the flag' due to lack of blood for both
himself and his 'weapon'. He'd black out if ever he could
raise his ardour enough to make it useful for anything more
than just a tease shot!! Therefore size can be disadvantageous!

no, not good. TiFKAS fails to realize that the humour of Beavis & Butt-head is that they're losers who think they're cool, but they're not. And idiots to boot. Just like ol' Sinclap...

>
> >
> >   I'm using both, pinhead.....

> Why? Opera not good enough?

Opera doesn't run on either machine, pinhead - you need a PC for that. Another example of TiFKAS not having enough computer knowledge that he has to bluff it....

BTW, where IS Opera for the Mac? Probably the same fate as Half-Life....

oh, we did have a lead in many things. We had better search & find utilities before Apple began touting them in OS8. And OS8 still can't search for text in archives like Holger Weets' Finder utility for the ST (so marvelous I paid my shareware fee after one session with it).

BTW, seems I read that there's no Java 1.2 for the Mac - how many years has it been now? Apple still has to play catch-up....

>

even if it's a secondary role it's still a use. But the 68000 is still a CPU chip, and it's still in use. So much for your computer knowledge.

and calling me a "dumb ass"? Just means I'm pushing all the right buttons. You're wiggling your ears and braying.....
>

no you haven't pinhead - you just posted web sites with no mention of your name and your position. Hardly evidence. You'd be found in contempt of court in you tried that in a courtroom.

The only acceptable evidence - name of business. Name of supervisor. Number and time where he can be reached.

great idea! I would put in a LS-120 instead of the floppy though.
can read/write floppies and 120 MB disks also. great for backing up that
2.5" IDE you put in the ST with the IDE board! :-)
Trouble is, upgrading an ST can cost more than it is worth, to
someone who doesn't already have one and the consequent experience,
knowledge, and software.
But this is what Mario Becroft has been diligently working on for the
past few years! He is coming out with an accelerator for the ST that
includes higher video(aka standard PC video card) and more memory-up
to 16MB I believe. Before non-atari users start laughing, that's more

than enough for almost anything you want to do. The only exception I
can think of is loading large graphic images.

As pointed out recently by Uwe Seimet, replacing the main floppy
by an LS-120 is a bad idea since, should your boot drive (e.g.
the internal 2.5") fail, you cannot boot from floppy anymore.

> Trouble is, upgrading an ST can cost more than it is worth,

That's to be expected of marginal markets.

hmmm. let me check on that. it makes sense but Rob Kuba of TAF installed
a LS-120, and I 'think' he said he can boot from it!? In any case an
external floppy drive would fix that problem immediately!!
(unfortunately not possible with the Falcon! :-(

I thought the 68000 series was dead. I did not know that Motorola was
making faster 060 chips that 50Mhz

I would love to get a ST. I am currently using Windows 98 but I am
get really tired of it. I am going back to my good ole Amiga. I
remember seeing the ST when it first came out and I loved it. I hear
it is good for audio stuff. I plan on getting into Audio technology
and would like a nice Atari for that

An Amiga is certainly not in the C64's class relative
to todays PC's. This is simply Lemming vanity and FUD.

Why not just get a BeOS system? Be is the logical sucessor to the Amiga
and ST...

No, the app is not like Quake were you do need a PPC! There are 040 machines in circulation but are no longer supported...If you want to use OS9 and X consumer, a PPC will be needed.

> Please note that TiFKAS is calling Macs junk, and is digging an even deeper hole...

You did... not me..

> as you have been constantly told in .advocacy (and you still continue to ignore) Motorola still makes the 060 becuase there's a use for it in embedded products. Motorola is helping in the design and manufacture of the new Milan board.

So when will this Motorola produced Milan see the light?

Earlier 68000 chips are on scaled down production or order only.
This inlcudes anything lower than certain models of 68030 down.

The 68060 is continuing to be developed however. Its most common
use is in embedded systems (x-ray machines, PLC controllers etc)
but of course it makes an excellent CPU dues to its inherent 680x0
architecture. 80-90MHz 060 are available now/soon. The most 'famous'
use of the 68060 was as the controller CPU's in the recent Mars
robot mission!

> and would like a nice Atari for that

A Falcon is a nice start for audio. A Hades060 with StarTrack DSP card
is apparently better (can record 16 stereo CD quality tracks of music

simultaneosuly?)...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

If discontinued stuff really was "priced to go" then I should
have been able to find Rev.D iMacs on discount, when the iMac
350 came out, but I didn't; they were _not_ discounted. Explain
that one, Sinclair? Or maybe Mr.Jobs should do it for you?

once again, TiFKAS' waster mentality comes to the fore - namely, if it
don't support the latest and greatest, it's junk.

seeing as I have no use for time wasters like Quake, I'm more
interested in the productivity side - and as I have said, there's still
plenty of third-party support out there. Third-party is better than NO
support. (And I'm finding plenty of 040 based games).

OS9? According to www.macintouch.com, it's pretty buggy, with many apps
falling over on it. OSX Consumer? 18 months late and growing later -
surely you know better than to use vapourware as an argument? Oops, you're
trying to emulate Steve Jobs' distortion field....

>
> >   Please note that TiFKAS is calling Macs junk, and is digging an even

oh, you're hallucinating again - "Chunks" does not exist.

and look who's talking about being a bully - I was talking to Ken about
you last night, and it seems you were trying your usual flaming e-mail
campaigns to try to get him to back off his complaint agaisnt you to Deja.
He never realized just what a foul mouth you have - but then, after Rich
Tietjiens shared with me your bullying tactics, I'm not surprised....

OKAY Milwaukee and Madison Atari users! Here's you're chance!

Get a picture of TiFKAS with a digital camera and post it to the net
within minutes! We're all curious to see what this troll looks like and
where he lives.

Of course, if he fails to show, be sure to report that too :)

>

something that TiFKAS needs to do - that is, if it weren't for the fact
that his head seems to be magnetically attrated to his alimentary
canal....

     Depends on what. For mp3 decoding you might have a point.
     For anything else where the OS is likely to get in the

     way, the P5/200 comparison is likely more valid.

I did not say he was an arrogant 'bonehead' your words...I was
wrong...Get over it...

Were you not wrong when you stated that it was too late to release the
new iMac DV's at this time? Just someone who thought that Apple's
manaufacturing division was the size of Atari's manaufacturing garage..

 what, you were right there - announcing new computers before they were
> even tested to make sure they worked is the mark of a true bonehead.
> Announcing new computers before they could ensure a plentiful supply is
> the mark of a bonehead. Trying to cancel orders of computers the company
> couldn't supply, then trying to make the suck^^^^^customers to re-order
> the same computers at $1000 more and not expecting a firestorm is the
> supreme act of arrogance, and the supreme definition of bonehead.

That 'bonehead' is more successfull than you are.. A genious that has
been able to launch new PB G3's, iMac DV's, G4 and OS 9 in five months
would have taken 'those boys' 20 years plus he has Pixar duty...

It's a moot point now. Will honor the previous clock speed... Get over
it!

>   of course, since TiFKAS fits the description of a blindered BOZO

     Free Software: because gloating about someone else not being
     able to do something is not quite as useful as allowing
     EVERYONE to do something.

[deletia]

     This is why a UNIX is becoming more relevant than Steve's
     'computer for the rest of us'.

To which I might add:

It is currently the most overpriced and worst supported piece of hardware outside California. Forget about finding anything Apple at a price that comes even close to the US list price; European prices are over inflated twice and Apple isn't helping.

So much for the oh-so-great iMac. Heil Jobs-less!

The iMac suffers from the same problem any non-Windows98
configuration does. It's not percieved as the biggest
marketshare chunk by the people writing the drivers. Thus,
you see remarkably less vidcards or SCSI cards, PCI even,
that will boot on a Mac.

This is despite the fact that PCI is an open standard.

USB suffers similar effects any time a hardware vendor
strays outside of a standard USB hardware type (quite
often).

At this point, MacOS is in the same position as BeOS and Linux.

Looks like the sinclap random string generator is back.
Someone must have forgotten to update the sinclap internal
data reference libraries, though. G3 266 PowerBook? That's
old technology, G3 PowerBooks are at 400MHz now.

By the way, has anyone successfully run sinclap on a CT2?
I can't get it to run with the fast RAM flags switched on.
Is it allocating critical buffer space in the ST RAM address
range?

I'd love to see how much quicker sinclap can spew garbage
at the higher clock speed (does anyone have a Mac executable?
What spew-rate does it achieve on the new G4 processors?
I'm sure that's a much better performance metric than the
weedy signal processing libraries they took from Intel's
web site to prove its performance over the PIII)

I think our friend has missed the point. It isn't the ATARI we're talking
68000, it's the Dragonball-based Pilot. When sinclap uses his Palm IIIx,
he's using "yester-decade technology".

Nothing can be done due to the heavily encrypted security
algorithms in the sinclap random string generator. It will
post drivel anywhere and everywhere, you can't stop it or
protect yourself against it (yet). Let's just hope it suffers
Y2K syndrome and kicks the bucket come 2000.

At the moment, I have a top team of experts working around
the clock to develop a sinclap suppressor, which will only
work on Atari systems. With a 8MHz 68000, we can already
achieve overall 23% attenuation of the output spectrum, but

somewhere along the line we're getting a bus error on the ST development system. Probably accessing an odd address at some point. I'll re-compile it for the 68030 and see if the same happens. We plan to open a web site soon, with all the latest patches for you to download.

Substitute Mac for Atari...Sound similar? Except that Atari is not mainstream..

Mac advocates and misplaced zeal
10/21 - Rodney O. Lain

Leave these men alone! Let them go! For if their purpose or activity is of human origin, it will fail. But if it is from God, you will not be able to stop these men; you will only find yourselves fighting against God.

--Acts 5: 38-39

Q. What is the hardest thing you, as an evangelist, ever had to do?

A. Admit to myself that despite all the evangelism that I did, Microsoft Windows was going to control the world.

--Guy Kawasaki

"Dear 'Guy' (I just realized that I don't even know your name - not the aformentioned Guy Kawasaki),

"I don't like to offend people intentionally, but it seems I offended you anyway.

"You're a pretty likable by all accounts, and you don't really cause trouble in the store -- that I know of. I'm sure that you read the Mac 'nets, so I want to be sure to say everything that I want to say this time, since I was too busy to talk with you at length this weekend.

"You probably were surprised that I blew up at you the other day. It wasn't planned, and honestly, I don't regret it.

"I didn't know any better way to say it; God, I don't even know if you heard everything that I said, because therein was my biggest frustration expressed.

"Try to understand my position. I used to do the same things you do: I used to visit computer stores and defend the Mac. I would literally sell computers to customers. I maintained the same siege mentality that you seem to be upholding. Today, however, a siege mentality is an anachronism for us Mac users -- it's no longer necessary. Like I did, you need to do some self-evaluation. Like I did, you need to see yourself as customers see you now: a person with misplaced zeal; a person who appears to have some Apple-lyptic mission to convert people by sheer force of will.

"This is how you are coming across.

"I wasn't going to say anything, but it became necessary. Nowadays, Apple Computer is a mainstream company that in many ways no longer needs us 'evangelists' to support the products and 'get the word out.' In the old days (which were not too long ago), Apple needed all the help it could get, since its management was ostensibly clueless.

"But, I hope you can see now that you don't need to devote as much time as you do now to hawking Mac wares in our store.

Please don't spend all day arguing with the Intel rep (that's my job :-). No, seriously, it just isn't professional, and I'd like to think that Apple would prefer if we Mac supporters would present a more mainstream image.

We do not need any sales help in the store. I do appreciate your zeal (sometimes I come across as a zealot in this column myself, so I can relate). On several occasions, I asked you if you'd like to apply for a job. I also asked you if you'd like to apply for a Demo Days' position.

You declined both times. Yet, you remain in the stores all day. Doesn't this seem a tad odd from a more objective standpoint?

You asked me if I meant everything that I said when I told you that I was tired of you being in the store. I said yes. I feel bad that I said it, but any other response would be a lie.

"These are painful things that need to be said. Many of them may be things that needed to be said to me in my most zealous moments.

"They need to be said, because Apple, Inc., and its Macintosh is entering a period of newfound celebrity. Customer satisfaction is high; public relations are a breeze. More and more people are switching to the Mac platform, in spite of the people who wish Apple would dry up and die (yes, believe it or not, there are people who will never use a Mac, due to bad past experiences or due to strong pro-Wintel preference) [1]. As for those who do buy Macs, though, they will need outgoing Mac users like you to help them make the transition.

"But what we need is a little more maturity than in times past. In the past it was excusable, because we were a persecuted minority. Every warm body was needed. Today, the Mac is a viable option; a mainstream choice.

"It's time we start acting like it."

Editor's Special Announcement: Did you like this editorial? I always LOVE Rodney's view of our world, as I'm sure you do, too.      The Mac is no more mainstream than anything else that
     is not Windows 98. So, you're gloating really is not
     at all justified. It's quite absurd really.

Hehe! ;^)

Thank goodness for that!!

BeOS and Linux would be better off with Saddam Hussein as a mascot
quite frankly!...

Kind regards,

Sounds like sour grapes...Whats the matter...the underpowered and
overprriced Milan have not reached the shores yet?

Looks like the iMac is indeed a success in Europe..  Also the higher
price is due to the high VAT to support the welfare state.

The iMac does not have PCI DUMBASS!!! The current iMac has ATI-Rage 128/
AGP graphics card plus the airport capability..

Get a MacMall catalog or log onto the web sites and see all the USB stuff
for the iMac to end your ignorance..

The deja stuff deleted and no way violated.   The above is my sig...Deal
with it! Plus, has been posted in comp.sys.atari.advocacy if you
bothered to read the forum part... I did not start this thread.

sinclap

"The iMac has been the biggest computer launch we've seen in

our history. Apple is back, and iMacs are flying off CompUSA store
shelves across the United States."

James Halpin, president and chief executive officer of CompUSA

Actually, the Milan is cheaper than the cheapest P333 PC, on this
side of the Trans-Atlantic Wet Stream, while the iMac costs twice
the price of an overblown PC.

> Looks like the iMac is indeed a success in Europe. The higher
> price is due to the high VAT to support the welfare state.

Even the less-VAT price is twice the 1199 USD list price.

     You can use a lot of bulk storage, HID and printer devices
     under Linux as well. That still doesn't remove the problem
     that any non-standard USB device requires its very own
     device driver for any OS you care to use it for.

     This includes Win98 vs. WinNT.

>
>>   This is despite the fact that PCI is an open standard.

     That doesn't matter when someone goes to buy a product
     and is in a total state of confusion when their !DOS
     oriented USB product provide drivers for their platform.

     I've actually read the USB spec and I keep up with USB
     driver development.

     That must have been why CivCTP was running on Macintoshes
     under Linux before it was running under MacOS.

     To a market obsessed with what's the biggest cash cow,
     second might as well be last.

TIFKAS, you are a childish moron who only gets satisfaction from making light of the choices of others. Are you as small of a person as you appear to be?!?

As far as "misplaced zeal," pretty much ANYONE with any need to "evangelize" a computer platform of ANY kind is silly in my view. It's just a tool.. it's not something important, like a spiritual awakening, a sunset, the birth of a child, creating a work of art, etc.

Your petty, childish, immature "evangelism" cannot make up for what may or may not be missing in your life, so stop trying.. stop using your choice of computer platform as your security blanket and frame of reference.

People see right through your apparent attempt to feel superior by denigrating the choices of others... grow up, buddy. It's time to move on now.

you know, if anyone could do it, it'd be Mario Becroft. Of course, he's busy right now with the new SCSI/Ethernet adapter for the ASCI port - can you say cable modem and network for cheap? :) Try that with a same-year vintage Mac.

BTW, have you seen QwertyX? We had a demo of it at one of the last TAF meetings, and I'm predicting he's going to have a LOT of success with this new adaptor. PC keyboard, PC mouse, Atari joystick, remapping of the keyboard, and all with no hack'n'slash (not that there's anything wrong with that :)). Ol' TiFKAS must be pucking blood....

Who cares!!! Old Mac users can upgrade to a modern class of Mac models
starting with the new $999 iMac/350 which includes 10/100 base-t, 128 ATI
Rage/AGP with 8 MG Vram, 64 Megs, 6 G, 56k and 14 software titles...Also
can accept the airport card and base. I am sure up north has the fast
selling out new iMac models.. See ehmac.com for the proof.

I have seen many LC users that were rightfully discourage to invest in
upgrades than it was feasible...like a $150 Cd-Rom multimedia kit, extra

memory and new modem that would have added none new capability when you
can goto the open market and purchase a used $400 PM 6500 or used iMac
that can run the latest...The Mac food chain is alive and well..

>   BTW, have you seen QwertyX? We had a demo of it at one of the last TAF

Actually, that's 1999 USD around here.

So?  A brand-new Milan is cheaper than a second-hand Falcon,
these days.  Same process here. Really nothing to be bragging
about, sinclap.  Every platform has its food chain.

It's unfortunate that Apple gouges oversees customers on its hardware. I have an iMac 266 and really enjoy it. It reminds me in many ways of the ST (I used to own a 520ST, a 1040STE, and a Falcon030 back in the day). It's fast, easy-to-set-up, easy-to-use, and reliable. Sure, it tends to crash just as much as my old 1040STE, but I don't mind. ;-)

The iMac isn't w/o fault but it's a damn good, general purpose machine. With a 266Mhz G3 and 160 megs of RAM, I can push plenty of pixels with Photoshop, exchange documents with my office via Micro$oft Word, crank out web pages with BB-Edit, surf the web to my heart's content with Netscape, burn CDRs with Toast, draw sprites with ProMotion 4 under Virtual PC, and even play many classic ST games with NoSTalgia.

The iMac is a decent machine. So was the ST/TT line. I may have converted to a devout form of Macintoshism but I'll always be an Atari fan at heart.

Don't judge the iMac harshly until you use it and don't judge all Mac users by the likes of Sinclair.

Your know, it's pretty sad. I've been reading comp.sys.atart.advocacy since 1993 when I was in college and Sinclair STILL hangs out here!

Doesn't he have anything else to do???

Ari

nope, not crap. You should read the user agreements before posting your usual spiteful drivel.

and speaking of which - just installed the filters in Eudora and POPwatch - TiFKAS' attempts to send me flaming e-mail - as he usually does when someone has been getting under his skin - have been thwarted once again. BTW, pinhead - get around those and I'll have you arrested for harassment....

Everyone seems to want to ramble on about Hasbro resurrecting Atari's name for software, all that's going to do is ressurect Atari's past successes like PONG, Centipede and Missile command etc, Now in their day, yes that were great games etc. but even updating them to 32/64/128 or 256 bit standards for graphics/gameplay etc isn't going to help them compete with the like of Tomb raider, Quakes , bango kazooi, Sega rally dreamcast etc. because Atari has only a limited ammount of titles to select from, what going to happen when these dry up, where are the next sales going to come from, perhaps Atari should start selling old ocean or usgold or activision s/w or horror of horrors old CBM64 software from CBM themselves, or colecovision, nes or Sega MD or MS software- do you want this to happen don't you

After all if youv'e followed Atari history in software publishing, you'd know that Atari triedf this type of thing with Atarisoft (converting Atari hits to c64 speecy, amstrad,apple pc etc) and Atari Interactive (converting Atari hits to PS, Saturn and PC) and these futile attempts at getting Atari known as a software developer were only remarkable for their apparent failiures and also because they eventually lead to Atari being bought out or being sold off as a going concern

I accept the fact that Atari failed because of BAD MGMT (Warners & Tramiels resperctively) ABSOLUTELY no consistant and cohesive sales & marketing stragedgy or plans (Tramiels only), or total lack of product knowledge (Warners again) but the 2 main reasons why Atari failed is

A- Atari wasn't prepared to invest in the very technology that it had created, and this was reflected in the fact that heaps of projects were either scraped or put on indefinate hold this is because Atari was ingnorant about the technology it had created, and if one is ingnorant of what one has, then how can you invest in ingnorance (this applies to both the tramiel and Warner managements- And because Atari wasn't prepared to invest in it's own technology, it therefore couldn't advance the developoment of it's own products and therefore it's own technology, which basically turns Atari from a creator and pioneer/inventer in these technologies, into little more then a mass manuf.. of electronic boxes with outdated technology, very much in the same guise of the mentallity of virtually every manuf. of games systems and computer technology.. ie selling masses of plastic boxes with outdated technology, without intending to update or advance the product or in the very least it's technology... Who is conning who, the manufacturers conning the end users, or is it the other way round

After all, it's an established fact that consumers are a fickle bunch, and they no longer have the same loyalty for brands these days as they once did, if that was so then why are Jap co's like sega sony nintendo, dominating an industry, ultimately created by Atari, because- it cant be the technology- because these other manufacturers are essentially putting Atari technology and design concepts, into theri own plastic electronic boxes, without advancing the development of product or it's technology, and if sega nintendo and sony stay on the same course any longer, they themselves will end up in the same situ. at our beloved atari, ie as a software producer

It's going to need a TRUELY ressurrected Atari (H/W and ALL) to breath some much needed life into a very stale and staid industry, and do something that the Atari of old and also these other so called games h/w manufs. haven't done and never did, and that's simply that Atari has to invest in the technology that it creates and to do that Atari needs to have confidence in the products, and instead of wasting money in ineffective advertising and marketing (which is what all previous Atari managements are guilty of), they should invest that money in advancing this new found technology, into modern standards, or tommorows standards, after all I remember someone telling me that technology designed today, or tommorow only lasts for ONE day

It's just a shame that no-one company has learned from Atari's mistakes and folly, they may think they have but they haven't

After all, you can take a look at any company product or service (doesn't have to be computers or v/g's) and just have a look at how the company views the product or service, after all if you don't have a prod. or svc. you have nothing to sell, nothing to sell= no business, the mistake that companies make these days, is that they've got to modify their sales/marketing, or they've got the snowball the consumer/end user with advertising, or that they've got to change their customer service/customer care program (if they have one) now I admit that these areas of business are very important, but what modern business (Atari included) has overlooked and there fore the most important, is the product or service and USP's/features and benefits are all well and good, but if you are not investing in the future development of your companies product or service, then USPs, features etc are irrelevant and pointless, also why should the consumer buy your products, after all the ultimate investor in any idea, product or service is the person or persons that buy's the idea/prod. or svc, this is called the consumer. and not the company doing the selling.. After all as the consumer is the ultimate investor, surely the consumer has a vested interest in the future development of that product or service, after all the consumer has just invested money in the company, the consumer needs confidence that the company will invest these funds effectively, and looking at it logically, if the company isn't interested in investing in advancing the development of the product or service and in the p/s related technologies, then will the consumer come back tommorow and buy the companies product again, what do you think (after all would you buy the same product using the same technology fromn the same comnpany say in 20 years or in 2 months from now, when you know that their competitors have vastly better products, and they are investing in advancing development of their p/s and related technologies- I DON'T THINK YOU WOULD), by investing in the product and

it's technology and development, you are investing in future custom, future custom= more investment in advancing development and technology in their p/s, only once this is investment framework is
firmly established, then the company then can start investing in supporting the product, in regards to marketing, advertising, sales, customer service/care etc, and not the other way arround, which is what virtually every single company is doing including those outside of the computing and v'g h/w ind.. After all if companies follow their current path they will be doing nothing more then making little more then electronic plastic boxes with outdated technologies, with a very limited market potential, youv'e all heard of the old saying about flogging dead horses and ever decreasing circles, think about it each time you go arround the block, selling the same prod. and each time you do this, they investment you get (ie people buying the product) isn't being invested in the godds/services themselves the more times you go arround the less you sell, you#ll get to the point where your'e not selling, as you have no product as it's now like flogging dead horses
Tied in with this reason, i refer to a listing that i saw in an American Business Directory (those Dunn & Bradstreet type jobbies), I remember a listing for a US company i think it was a small incorporated cloting company, had a look at it's personnel listing (8 snr vice pres. 5 Exec. vice pres. 15 vice pres) now your most probably saying, so what, now if this is for a small cloting co. I'd hate to think of what the numbers would look like for a larger US multinational- for just one of the US offices, take a guess 4, 5 or 6 x, or how about 10 or 20 x, and remember that these people people were hired and put into these positions of responsibility because they were good at making 'DECISIONS', now think of this structure, a manager, he has to report to a manager, he then reports to a manager, who reports to a manager, in another department, who reports to a manager, her then reports to a manager, who reports to a manager in another department, and so on and so forth till you get to the top, and just imagine this same process happening when one department needs a decision on a new idea in advancing devlopment in existing product(s) and it's related technology, all it needs is one manager, be it a VP, SVP or EVP from the same dept, or a related dept or even a total unrelated dept who have alterior motives to say no, and that wipes out the entire efforts of one or several entire divisions/dept... and for what, short term prestige/gains, what about the long term, what about the continued survival of their product in the face of competing products (from companies with lesser rigid structures and also beleive in investing in their p/s future advances and developement), and not only thant but how will this other company survive, whats going to happen to the structure of decision making, the future of their product (so far as advances and deveopments are concerned), creativity and commitment to the company itself, all that's going to happen is people will leave, because the company isn't interested in the product and it's future the people will not have faith or confidence in the direction the company is taking, it's decision making process, there will be no creativity and therefore no committment
Essentially the companies structure becomes beaurocratic and therefore area's like creativity, product advancement and development, decision making and committment are stifled, to such an extent it drives people to leave, which is ironic because, wasn't it these very same people

that got the company and the product/service to where it is today, and remembering the concept about the consumer being the ultimate investor, if this is so then the penultimate investor is the employees (who have as much vested interest in the future developement and advancement in the companies product/service)and what happens when they leave, everyone moves up one, but the problems stay the say, and because virtually all companies have the same philsophy, are these people who are leaving, going to join their competitors, i don't think so, all that will happen is that they will set up their own company, selling the same prod/serv., wtih the same technology (because they don't yet have the investment to advance the tech.) so straight of the bat they allready in a hole facing an uphill struggle to compete with est'd names, in an ever decreasing market (I was once told that the average market share for any new entrant to any market for the first 5 years is the equivalent to the ammount of brain capacity as used by human beings which is less than 10%, my thought is, is it realy worth it) and because more and more companies are competing for less and less market share (in the same market-ie USA etc) all it will need is a foreign competitor to advance and develope the same product with new technologies, and actually invest in it- and they've virtually got the market sown up, because existing users aren't going to wait while their current suppliers start advancing their product, irrespective and regardless of the quality or their sales/marketing/advertising/customer care/service, because as you remember consumers are very fickle, they want the latest thing, which means they will go with whichever company is prepared to invest in it's own product (thru advances in product/service development and related technologies-thus investing their customer investment wisely/effectively), so therefore theres always going to be a decline in so call brands loyalty- You cannot compute, eat, see or sleep image, or marketing or sales or advertising or customer service/care, these are things that are earnt or created as a resulting of investments made by the consumer, the only way you can create or earn image, marketing, sales ,advertising or customer service/care is by investing in your customers confidence and faith in the future advances and development in the prod./serv., and the only way a self respecting company can invest in this concept, is by doing so.... but no-ones doing so, so ultimately instead of going forward into the '3rd Millenium' we might as well go back to the 1st millenium
Atari failed simply because of what I outlined above, little of no investment in advancing their product and related technologies, little or no creativity, no commitment to atari's concepts, to beaurocratic, you might as well say that virtually every company involved in video games h/w of s/w was born and created on the back of Atari's technology, and unless they change their ways they will suffer the same indignity
Yes, we are still using Atari technology, but it's in someone elses plastic electronic box, sold just like baked beans, jeans, perfume... wheres the sense in that... I though Atari's represented computers and video games h/w with a personality- ie Atari technology in Atari boxes, and not someone elses, BUT with Atari investing in the future advances and development of their (ATARI'S) product and it's related technologies

The second reason why atari failed is because the American consumer simply gave up on Atari, they didn't like the idea about Atari, an

American company dominating an industry that Atari itself had created, so they showed their support to ATARI, by buying sega, nintendo and eventually sony or to put it another way buying, Atari technology in someone elses boxes
interesting when you consider that Sony, Sega & nintendo are JAPANESE companies, and I am constantly told that American's cant stand buying JAP goods (talk about contradiction big time), and according to most european and US computing press and commentary during the tramiel era, it was the European markets (incl.UK) that was keeping Atari going (or at least alive and surviving) whilst you American's were content in buying Sega sony and nintendo, or buying, Atari technology in someone elses boxes

perhaps I am wrong, there again I live in a so called democratic country (England) so i guess with the so called freedom of speach concept (what- freedom of speach- democracy- england, you are joking aren't you) anyway I guess i'm entitled to my opinion, even if others don't neccessarily aggree... But in saying that, as anyone who has an ounce of HUMAN intelligence will know, sooner or latest this internet thing with simply become an unweildy authority with an unweildy institutionalised mentallity

Yours

Carmel A

TORONTO ATARI FEDERATION FLEA MARKET NOVEMBER 17TH!

Yes, folks, it's time once again for users of the classic Atari 8-bit, ST, TT and Falcon computers to come to the annual event where you can divest yourself of what you don't need while at the same time hunt out for what you do! Sell your old stuff, discover a treasure!

Among other things you'll find at this event:

classic systems! Looking for that Falcon? Wished you had an STe and its expanded capabilities? Do you need a 600XL for your collection? There's a good chance you'll find it here!

hard-to-find games, peripherals, literature and applications!

TAF Software Library, carrying hundreds of PD/Shareware games, utilities applications, as well as the TAF Internet discs! Plus we'll be selling 720K floppy disks, stock up! The membership desk will also be up for renewals as well as new members.

the camaraderie of fellow Atari users - swap stories, troubleshoot, ask for advice! Meet some of the faces you've only read online on the Internet!

Ken Macdonald's demonstrations and sales of the various Mario Becroft adaptors for Ataris. Use a PC three-button mouse with the Mouse Adaptor, plug & play, works with Ataris and Amigas! Use a PC keyboard, PC mouse and Atari joystick with the amazing new QwertyX adaptor, no soldering required! Give your ST or STe amazing storage capacity with the Internal IDE Adaptor kit - program storage, add a CD-ROM, use an LS-120 internal drive to replace your disk drive! And, with the VGA Adaptor, use any VGA or SVGA PC monitor with your Atari ST to get a beautiful hi-res display!

All this and MORE!

It's a night of fun and commerce, and it's being brought on by the one, the only, Toronto Atari Federation - bringing you the best in Atari-related computer info and enjoyment since 1984! See you there!

Flea Market details:

Admission and tables for TAF members: Free
Admission for non-members - $2.00 (one thin toonie)
Tables for non-members - $5.00 (admission waived if you purchase a table.

NO STOLEN ITEMS OR PIRATED SOFTWARE ALLOWED! VIOLATORS WILL BE PROSECUTED TO THE FULL EXTENT OF THE LAW.

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

   no, but I think that they would be afraid of the RCMP. And the Toronto
City Police. And the Ontario Provincial Police. All of whom have the best
interests of the public in mind to any cretins who think they can fence
stolen or pirated property at our events. And the fact that they could go
to jail for a very very long time and face stiff fines (software piracy IS
a federal offence here, punishable by a ten year jail sentence and fines
of up to $1M)

```
   And besides, I don't threaten. I warn. And I make promises that I keep .:)

   and look who's calling me "spineless" - the little jellyfish who has no
backbone or fortitude to back up his boastings with fact.

seeing as this is coming from the unbelievable, lying-sack-of-rat hair known as TiFKAS, we really can't believe you.

And once again basing insults on appearance of people you haven't met face-to-face? My my, TiFKAS, what a bitter petty person you are - did you also beat up on crippled kids when you were little?

BTW, it's spelled "acne" and "re-engineered". Proof positive that no one would ever hire such an utter idiot as you at Apple other than as a janitor...

once again, your utter hatred of feminists is coming to the fore, TiFKAS. Did a feminist bitch-slap you when you said something amazingly sexist?

You were warned TWICE not to send me e-mail, pinhead. And I know you've taken part in this behaviour of intimidation several times with those you disagreed with, to the point that you were kicked off Hotmail in one incident.

Like I said, I don't threaten - I make promises which I intend to keep.
>
> just sinclap

just another loser who's too chicken to reveal who employs him as an "apple Power Rep"....

That's about $500 worth of PC, mebbe less. It really doesn't
do your position any good to brag about how overpriced a
Mac with skanky PC hardware is.

[deletia]

You can't demonstrate what this years version of msoffice
can do over last years version of clarisworks & the mac is
a second class 'entertainment' software platform.

Better advice would be for him to pick up a $200 dreamcast
and mebbe a copy of SoulCaliber... '-ppp

     You do know that you can get both of those kinds of adaptors
     for USB? Although, you still have to cover the device driver.
     Then again, Linux or FreeBSD source could be useful in such
     an endeavor.

Nah, I'm a Linux user. I might eventually get around to buying
a PPC system capable of running MacOS instead of running Linux
on my Kludge Klone, however I am still technically a 'PC user'.

The biggest dissuasion there (me buying a Mac) is the lack of
suitably optimized compilers and the crap vidcards Apple insists
on shipping with it's machines (ATI).

[deletia]

The effective Apple argument has always been convenience
and performance. Price has never been an Apple strong point.
Price is an issue best AVOIDED by a MacVocate.

Well for one I would, I own quite a few Software Title not in the Public Domain and I am not releaseing them...so more power to Toronto Atari Users.

BTW I hope the event is a sucess, I have really good memories of my visit to Toronto a few years ago.... even if you still can't brew Beer.

Its quite easy to press charges against pirates. You just tell the software
distributors who and what is the problem, and in no time they'll have police
knocking on the door of the perpetrator asking to see their receipt of
purchase or licence. At least thats how it works here...

It is you who are spineless sinclap. It is also evident that your general
knowledge is sadly lacking. If, for example, I knew you to be using pirated
software, I could call the distributors of the software and dob you in with
relative ease. They would have no problem in tracking you down and investigate
you for illegal software use...and I could do that even from here in New
Zealand!

Get a reality check pal...

Until relatively recently non-commercial software piracy wasn't even a criminal offense in the US. Now it's still only a criminal offense if the 'total theft' is $1000 or more.

Unless he was distributing, the SPA (the people who you would want to snitch to) would really not be interested. Depending on the platform they might not even care.

There was a Atari snitch that experienced indifference from the SPA at some point before Atari finally went under. Apparently they didn't care since the offense wasn't being perpetrated against a member company.

a good reality check would probably be for ol' TiFKAS, seeing as he thinks he so smart, to try to sell some pirated software or stolen property at the TAF Flea Market - a police choke hold, a night in the Don Jail, and a deportation hearing may be just enough for him to get the slightest nugget of a clue in that thick head of his :)

Thnaks for the support guys..

and, TiFKAS - heard about the Daily Tubby? Seems the good news is that they've achieved fairly good readership. The BAD news is that they've lost $37M and they're still bleeding red ink, and there's some scepticism about those numbers - know that the Tubby has one of the highest remaindered amounts at newstands in Toronto?

"But what are the upper crust? Just a bunch of crumbs being held together by dough!"

-Mary Walsh (as Marg Delahunty), commenting on Conrad "Tubby" Black

A minor correction, the old iMacs ran on a PCI bus, they just didn't have a PCI slot...for the most part. Apple DID include a "mezzanine" connector on the bottom of the "Bondi Blue" iMacs. I have a Voodoo2 card in mine right now.

Bitch to get to though.

The new iMacs run on a Firewire bus under UMA I believe.

I agree on the videocard issue, my iMac now has a 3Dfx chipset in it, (see previous post). The ATI is really pathetic.

When it comes to compilers, I was under the impression Codewarrior was good. However, they have been bought out by Motorola, so things should improve further.

     A Metrowerks compiler for Linux does not yet exist.
     What Metrowerks is shipping is just the IDE with
     gcc underneath.

I guess I'm refering to commercial software. 'Owning' even a small
pirated program worth say US$100 is considered an investigable crime
if the distributor/author wish to pursue it here. A few illegal ops
have been uncovered here based on following an individual user back
down the chain...

> Unless he was distributing, the SPA (the people who you would
> want to snitch to) would really not be interested. Depending
> on the platform they might not even care.

Even if he wasn't distributing, the author would have their best interests
at heart to see where he got his copy from...

> >you for illegal software use...and I could do that even from here in New
> >Zealand!
>
> Don't assume that copyright law is Universal.

Copyright law isn't universal as you correctly point out, but the telephone
system is! A phone call to a lawful distributor/author is all it has taken
in a few cases here to get the ball rolling, and eventually bring down a
pirated software ring...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

     No it isn't. The USC section on what constitutes
     criminal piracy clearly states that the total
     offense must be $1000 or more or that the software
     is being rented or resold.

     The $1000 non-commercial piracy bit only was added within
     the last 18 months.

     Previously, no piracy not for commerical gain was a
     criminal offense in the US.

     The most an author could get out of such a cause of action
     is spite litigation and even a judgement in that instance
     would be dischargable.

Sounds like the prisoners dilemma in action, with a little fraud thrown in.

Not in the US.

Until fairly recently, ALL non-commercial piracy of any kind was a purely civil matter.

[deletia]

The current 'criminality threshold' in the US is $1000.

Amiga has been "making a comeback" for the last 10 years, to the
point that User Friendly comics had something on the topic.

Anyhow, most users are now running Linux on their Amiga so, what
remains of the Amiga fame, other than the hardware?

I was initially amused when I heard the "big news" from Gateway,
but seeing as they are looking at the same lame Intel crap other
meatball PCs out there use (so what if it runs Linux on it?), no
one could ever consider call that an Amiga so, what's the point?

The Amiga was interesting primarily because of what
was outside of the CPU. One could still make an
Amiga-esque intel box. Hell, the Amiga's themselves
had ISA slots.

Admittedly, such a venture would be too much work for
any 'cheap over everything' PC vendor to undertake.

Won't happen, at least not from AInc.

Anyhow, most users are now running Linux on their Amiga so, what
remains of the Amiga fame, other than the hardware?

Really?. Most?. Did you just make that up ot was it a guess?. Most Amiga
owners still run AmigaOS in reality. OS3.5 has just been released don't you
know...

I was initially amused when I heard the "big news" from Gateway,
but seeing as they are looking at the same lame Intel crap other
meatball PCs out there use (so what if it runs Linux on it?), no
one could ever consider call that an Amiga so, what's the point?

I agree but...

What is your problem with Intel CPU's exactly?. Isn't it somewhat ironic
that you consider 500Mhz plus Intel CPU's as lame crap when you are probably
still using an old, outdated and performance handicapped 680x0 on an Atari
?.

Let's put things in perspective here.

Regards,

Clockmeister.

Indeed, let's do that:

I am presently answering this mail using Pine on MiNT. The binary
size is just below 2MB and memory consumption too. On Linux PC,
make that 5 MB and 8 MB, respectively, for the same Pine version.

Basicaly, Intel technology is so bloated that a port of the same
package requires 3 to 4 times the amount of system resources and
a CPU a 100 times faster, to become usable.

So, is Motorola 680x0 technology really so outdated?
The numbers spoke; I rest my case.

My problem is that they are basically hyper-overclocked 8086s. Maybe they should try and do something that isn't a rehash of 20 year old technology.

Which is precisely my point, and User Friendly's: Amiga's Big Comeback is as likely as UFO invasions or Elvis' return.

No arguement here. Atari's position is no different.

> Anyhow, most users are now running Linux on their Amiga so, what

Actually, around here, the Amiga and Atari scenes are not as compartimented as elsewhere and everyone I know uses Linux 68k.

Around here, and judging by the newsgroups and the ever increasing amount of software (on Aminet) for AmigaOS, the rest of the world still uses AmigaOS primarily.

> Most Amiga owners still run AmigaOS in reality. OS3.5 has

Indeed, let's do that:

I am presently answering this mail using Pine on MiNT. The binary size is just below 2MB and memory consumption too. On Linux PC, make that 5 MB and 8 MB, respectively, for the same Pine version.

Basicaly, Intel technology is so bloated that a port of the same package requires 3 to 4 times the amount of system resources and a CPU a 100 times faster, to become usable.

Yeah, right.

So, is Motorola 680x0 technology really so outdated?
The numbers spoke; I rest my case.

Based on Pine?. Some people place somewhat higher demands on their systems... try rendering something, or some multimedia applications. 68k don't cut it anymore.

I rest my case.

Regards,

Clockmeister.

Yes, but the ISA slots where completely isolated from the Amiga and could
only be accessed via a bridgeboard (PC card) and then only by the PC card
itself.
A Goldengate card can access and utilize the ISA slots in a bigbox Amiga,

but these weren't available until much later.

if you haven't heard the news yet, then here it is...

http://www.msnbc.com/news/329416.asp

"WASHINGTON, Nov. 5 � The judge in the historic antitrust trial of software giant Microsoft Corp. ruled Friday that the software giant wields monopoly power in personal computer operating systems and issued a decision highly favorable to the government."

JUDGE THOMAS PENFIELD JACKSON said that �to the detriment of consumers ... Microsoft has done much more than develop innovative browsing software of commendable quality and offer it bundled with Windows at no additional charge.� As has has been shown, �Microsoft also engaged in a concerted series of actions designed to protect the applications barrier to entry, and hence its monopoly power from a variety of middle-ware threats including Netscape�s Web browser and Sun Microsystems implementation of Java,� the judge said."

Spin this, wintrolls.

By reading the findingg of fact, I just realized that if it weren't for Netscape not taking MS's offer to split the browser market back in 1995, Mac users will not have been able to surf the net today! We owe a lot to Netscape. They died like men.

"Also extremely damaging to Microsoft, the judge sided with then Netscape CEO James Barksdale version of a meeting between Netscape and Microsoft executives in June of 1995. In that meeting Barksdale alleged that Microsoft offered to divide the browser market with Netscape in a way that Microsoft would provide its Internet Explorer Web browser for Windows PCs, relegating Netscape to the tiny market place of other computers like the Macintosh and Unix servers. �Had it convinced Netscape to accept its offer of a �special relationship,� Microsoft quickly would have gained such control over the extensions and standards that network-centric applications (including Web sites) employ, as to make it all but impossible for any future browser rival to lure appreciable developer interest away from Microsoft�s platform,� the judge stated."

another message from Znu on the findings in fact on M$ - and about Apple.

Znu presents all the good and bad regarding Apple in the judge's ruling, unlike a certain clueless troll who, when not hallucinating about his imaginary friend "Chunks", pretends to be an "Apple Power Rep"...

In case you missed it, see http://usvms.gpo.gov/findfact.html and http://www.msnbc.com/news/329416.asp

In the interest of fairness, I'm going to present just about all the Apple references in the 207 page document, not just the ones that back up the Mac advocate view.

"In 1995, Microsoft introduced a software package called Windows 95, which announced itself as the first operating system for Intel-compatible PCs that exhibited the same sort of integrated features as the Mac OS running PCs manufactured by Apple Computer, Inc. ("Apple"). Windows 95 enjoyed unprecedented popularity with consumers, and in June 1998, Microsoft released its successor, Windows 98."

MS is copying Apple.

"The response to a price increase would be somewhat greater among consumers buying their first PC system, because they would not have already invested time and money in an Intel-compatible PC system and a set of compatible applications. Apple does not license the Mac OS separately from its PC hardware, however, and the package of hardware and software comprising an Apple PC system is priced substantially higher than the average price of an Intel-compatible PC system. Furthermore, consumer demand for Apple PC systems suffers on account of the relative dearth of applications written to run on the Mac OS. It is unlikely, then, that a firm controlling the licensing of all Intel-compatible PC operating systems would lose so many new PC users to Apple as the result of a substantial, enduring price increase as to make the action unprofitable. It is therefore proper to define a relevant market that excludes the Mac OS. In any event, as Section III of these findings demonstrates, including the Mac OS in the relevant market would not alter the Court's conclusion as to the level of Microsoft's market power."

The Mac doesn't compete with Windows.

"The inability of Apple to compete effectively with Windows provides another example of the applications barrier to entry in operation. Although Apple's Mac OS supports more than 12,000 applications, even an inventory of that magnitude is not sufficient to enable Apple to present a significant percentage of users with a viable substitute for Windows. The absence of a large installed base, in turn, reinforces the disparity between the applications made available for the Mac OS and those made available for Windows, further inhibiting Apple's sales. The applications barrier thus prevents the Mac OS from hindering Microsoft's ability to control price, regardless of whether the Mac OS is regarded as being in the relevant market or not."

The applications barrier to entry is nearly impossible to overcome.

"In their discussions with Apple, Microsoft's representatives made it clear that, if Apple continued to market multimedia playback software for Windows 95 that presented a platform for content development, then Microsoft would enter the authoring business to ensure that those writing multimedia content for Windows 95 concentrated on Microsoft's APIs instead of Apple's. The Microsoft representatives further stated that, if Microsoft was compelled to develop and market authoring tools in competition with Apple, the technologies provided in those tools might very well be inconsistent with those provided by Apple's tools. Finally, the Microsoft executives warned, Microsoft would invest whatever resources were necessary to ensure that developers used its tools; its investment would not be constrained by the fact that authoring software generated only modest revenue.

....

Jobs reserved comment during the meeting with the Microsoft representatives, but he explicitly rejected Microsoft's proposal a few weeks later. Had Apple accepted Microsoft's proposal, Microsoft would have succeeded in limiting substantially the cross-platform development of multimedia content. In addition, Apple's future success in marketing authoring tools for Windows 95 would have become dependent on Microsoft's ongoing cooperation, for those tools would have relied on the DirectX technologies under Microsoft's control."

Here we see MS trying to kill QuickTime for Windows.

"Finally, it is significant that, while all vendors of PC operating systems undoubtedly share Microsoft's stated interest in maximizing consumer satisfaction, the prohibitions that Microsoft imposes on OEMs are considerably more restrictive than those imposed by other operating system vendors. For example, Apple allows its retailers to remove applications that Apple has pre-installed and to reconfigure the Mac OS desktop. For its part, IBM allows its OEM licensees to override the entire OS/2 desktop in favor of a customized shell or to set an application to start automatically the first time the PC is turned on. The reason is that these firms do not share Microsoft's interest in protecting the applications barrier to entry."

Wasn't there a question about whether Apple allowed this?

"Recognizing the importance of Mac Office to Apple's survival, Microsoft threatened to cancel the product unless Apple compromised on a number of outstanding issues between the companies. One of these issues was the extent to which Apple distributed and promoted Internet Explorer, as opposed to Navigator, with the Mac OS."

MS essentially forced IE on Apple

Well, there are some rather interesting comments on Apple in this. Most notably, he judge seems to have divided that from MS's point of view, Apple is not a competitor.

I�d like to point out before some PC users cease on this to try to prove Apple is a monopoly that just because Apple isn�t a competitor to MS does NOT mean that MS isn�t a competitor to Apple. IOW, MS can double prices without worrying about many people a Mac, Apple can't double prices without worrying about many people getting a PC.

well well well, the truth will out - and the Reality-Distortion Field is crumbling....

seems that ol' Bill Gates WAS ready to crush Apple like a bug if Steve Jobs didn't capitulate on IE4 on the Mac! Just like he did with John Sculley when Apple dared to try to market their own version of BASIC that directly competed with M$. And Jobs thinks Sculley was a feeble-brained wimp?

How does it feel, TiFKAS, now that it has been proven that Jobs didn't have the cojones to immediately report Gates to the proper law authorities, but instead immediately sold out Apple to Microsoft?

Excerpt from findings of fact regarding Microsoft's threats to cancel Office in an attempt to get Apple to deemphasize Navigator. If you think this is too long to read it all, just be sure you read the last paragraph.

6. Foreclosing Apple as a Distribution Channel for Navigator

341. In the summer of 1995, Microsoft had been willing to cede to Netscape the development of browsing software for the Mac OS, provided that Netscape would stop competing with the platform-level browsing technologies that Microsoft was developing for its 32-bit Windows products. The genesis of this offer had been Microsoft's belief that Netscape could never become the leading platform for network-centric software development if it did not distribute a middleware layer for the soon-to-be dominant 32-bit Windows platform. But once Netscape confirmed its determination to offer a middleware layer that would expose the same set of APIs on Windows, the Mac OS, and other platforms, Microsoft recognized that it needed to stifle the attention that developers would be inclined to devote to those APIs, even when the they rested on top of a non-Windows platform like the Mac OS. After all, if Navigator became so popular on the Mac OS that developers made extensive use of the APIs exposed by that version of Navigator, those developers would be disposed to take advantage of identical APIs exposed by the version of Navigator written for the dominant platform, Windows. Microsoft therefore set out to convince developers that applications relying on APIs exposed by Navigator would not reach as many Mac OS users as applications that invoked platform technologies found exclusively in Windows. Therefore, Microsoft set out to recruit Mac OS users to Internet Explorer, and to

minimize Navigator's usage share among Mac OS users.

342. Just as pre-installation and promotion by OEMs is one of the most effective means of raising the usage share of browsing software among users of Intel-compatible PC systems, pre-installation and promotion by Apple is one of the most effective means of raising the usage share of browsing software among the users of Apple PC systems. Recognizing this, Bill Gates consistently urged Microsoft executives to persuade Apple to pre-install the Mac OS version of Internet Explorer on its PC systems and to feature it more prominently than the Mac OS version of Navigator.

343. By the summer of 1996, Apple was already shipping Internet Explorer with the Mac OS, but it was pre-installing Navigator as the default browsing software. After a meeting with Apple in June 1996, Gates wrote to some of his top executives: "I have 2 key goals in investing in the Apple relationship - 1) Maintain our applications share on the platform and 2) See if we can get them to embrace Internet Explorer in some way." Later in the same message, Gates expressed his desire that Apple "agree to immediately ship IE on all their systems as the standard browser."

344. One point of leverage that Microsoft held over Apple was the fact that ninety percent of Mac OS users running a suite of office productivity applications had adopted Microsoft's Mac Office. In 1997, Apple's business was in steep decline, and many doubted that the company would survive much longer. Observing Apple's poor performance in the marketplace and its dismal prospects for the future, many ISVs questioned the wisdom of continuing to spend time and money developing applications for the Mac OS. Had Microsoft announced in the midst of this atmosphere that it was ceasing to develop new versions of Mac Office, a great number of ISVs, customers, developers, and investors would have interpreted the announcement as Apple's death notice.

345. Recognizing the importance of Mac Office to Apple's survival, Microsoft threatened to cancel the product unless Apple compromised on a number of outstanding issues between the companies. One of these issues was the extent to which Apple distributed and promoted Internet Explorer, as opposed to Navigator, with the Mac OS.

346. At the end of June 1997, the Microsoft executive in charge of Mac Office, Ben Waldman, sent a message to Gates and Microsoft's Chief Financial Officer, Greg Maffei. The message reflected Waldman's understanding that Microsoft was threatening to cancel Mac Office:

The pace of our discussions with Apple as well as their recent unsatisfactory response have certainly frustrated a lot of people at Microsoft. The threat to cancel Mac Office 97 is certainly the strongest bargaining point we have, as doing so will do a great deal of harm to

Apple immediately. I also believe that Apple is taking this threat pretty seriously . . . . 347. Waldman was actually an advocate for releasing Mac Office 97 promptly, and he pressed for that outcome in his message to Gates and Maffei. Although they applauded Waldman's devotion to the product, Gates and Maffei made clear that the threat of canceling Mac Office was too valuable a source of leverage to give up before Microsoft had extracted acceptable concessions from Apple. Maffei wrote Waldman, "Ben - great mail, but [we] need a way to push these guys and this is the only one that seems to make them move." In his response to Waldman, Gates asked whether Microsoft could conceal from Apple in the coming month the fact that Microsoft was almost finished developing of Mac Office 97.

348. In order to assure his superiors that he was pursuing corporate policy despite his personal convictions, Waldman reported to Maffei in his June 1997 message that he had recently told his counterpart at Apple that Maffei "would be recommending to Bill [Gates] that we cancel Mac Office 97." Waldman believed that his counterpart "got the message that we would, in fact, cancel." Waldman went on to write that when his counterpart had asked what specific problems Microsoft had with Apple's recent response to Microsoft's proposals, Waldman had replied by mentioning four issues, including "IE equal access." By that, Waldman meant Microsoft's demand that the Mac OS make Internet Explorer just as available to its users as it made Navigator. According to Waldman, the Apple employee had responded that Apple would not be able to change the Mac OS's default browser from Navigator until it released the next version of the operating system product in the summer of 1998.

349. A few days after the exchange with Waldman, Gates informed those Microsoft executives most closely involved in the negotiations with Apple that the discussions "have not been going well at all." One of the several reasons for this, Gates wrote, was that "Apple let us down on the browser by making Netscape the standard install." Gates then reported that he had already called Apple's CEO (who at the time was Gil Amelio) to ask "how we should announce the cancellation of Mac Office . . . ."

350. Within a month of Gates' call to Amelio, Steve Jobs was once again Apple's CEO, and the two companies had settled all outstanding issues between them in three agreements, all of which were signed on August 7, 1997. Under the agreement titled "Technology Agreement," which remains in force today, Microsoft's primary obligation is to continue releasing up-to-date versions of Mac Office for at least five years. Among the obligations that the Technology Agreement places on Apple are several relating to browsing software.

351. First, Apple has agreed, for as long as Microsoft remains in compliance with its obligation to support Mac Office, to "bundle the most current version of Microsoft's Internet Explorer for Macintosh . .

. with all system software releases for Macintosh Computers (`MacOS') sold by Apple." The Technology Agreement also provides: "While Apple may bundle browsers other than Internet Explorer with such Mac OS system software releases, Apple will make Internet Explorer for Macintosh the default selection in the choice of all included internet browsers (i.e., when the user invokes the "Browse the Internet" or equivalent icon, the Mac OS will launch Internet Explorer for Macintosh)." In fulfillment of this requirement, Apple did not include Navigator in the default installation of the Mac OS 8.5 upgrade product. In other words, Navigator is not installed on the computer hard drive during the default installation, which is the type of installation most users elect to employ. Therefore, most users who upgraded their Macintosh systems to Mac OS 8.5 were unable to access Navigator without doing a customized installation. Having already installed an altogether adequate browser (Internet Explorer) when the Mac OS 8.5 upgrade completed its default installation process, however, most users are unlikely to trouble to install Navigator as well.

352. The Technology Agreement further provides that "[a]ny other internet browsers bundled in the Mac OS system software sold by Apple shall be placed in folders in the software as released." In other words, Apple may not position icons for non-Microsoft browsing software on the desktop of new Macintosh PC systems or Mac OS upgrades. Moreover, the agreement states that "Apple will not be proactive or initiate actions to encourage users to swap out Internet Explorer for Macintosh." Both Apple and Microsoft read this term to prohibit Apple from promoting non-Microsoft browsing software. The agreement even states that Apple will "encourage its employees to use Microsoft Internet Explorer for Macintosh for all Apple-sponsored events and will not promote another browser to its employees." Pursuant to this provision, Apple's management has instructed the firm's employees to not use Navigator in demonstrations at trade shows and other public events. Also with regard to the promotion of browser technology, the agreement requires Apple to display the Internet Explorer logo on "all Apple-controlled web pages where any browser logo is displayed." Finally, the agreement grants Microsoft the right of first refusal to supply the default browsing software for any new operating system product that Apple develops during the term of the agreement.

353. At the same time that it entered the Technology Agreement, Microsoft concluded a "Preferred Stock Purchase Agreement" and a "Patent Cross License Agreement" with Apple. These latter two agreements place obligations on Microsoft that are unrelated to Mac Office, and they bind Apple in areas other than browsing software. The fact that Microsoft and Apple entered two other agreements at the same time that they entered the Technology Agreement does not change the fact that Microsoft's commitment to continue developing Mac Office was at least partial consideration for Apple's commitment to distribute and promote Internet Explorer more favorably than Navigator. Indeed, the language of the agreements themselves demonstrates that Microsoft and Apple saw the Mac Office and Internet Explorer obligations as more closely linked to each

other than to any other obligations the parties simultaneously undertook: Whereas the provision in the Technology Agreement setting forth Apple's obligations relating to browsing software explicitly states that those obligations will last as long as Microsoft complies with its obligation to continue supporting Mac Office, the provisions in the other two agreements describing the patent cross-license and Microsoft's purchase of Apple stock mention neither browsing software nor Mac Office.

354. That the Mac Office and browsing software obligations are tied to each other is highlighted by the fact that the Microsoft executives who negotiated the agreement believe that Microsoft's remedy, were Apple to fail to meet its obligations with respect to browsing software, would be to discontinue Mac Office. When, in February 1998, a Microsoft employee proposed giving Apple an HTML control in exchange for Apple's agreement to use Internet Explorer as its standard browser internally, Waldman informed the employee that Apple was already obligated to use Internet Explorer as its standard browser internally and that Microsoft would revive the threat to discontinue Mac Office if Apple failed to comply with its obligation. In Waldman's words:

Sounds like we give them the HTML control for nothing except making IE the "standard browser for Apple?" I think they should be doing this anyway. Though the language of the agreement uses the word "encourage," I think that the spirit is that Apple should be using it everywhere and if they don't do it, then we can use Office as a club.

For at least a year after the Technology Agreement went into effect, Waldman and other Microsoft employees continued to use the threat of reduced commitment to Mac Office in holding Apple to its commitments to support Internet Explorer.

355. Apple increased its distribution and promotion of Internet Explorer not because of a conviction that the quality of Microsoft's product was superior to Navigator's, or that consumer demand for it was greater, but rather because of the in terrorem effect of the prospect of the loss of Mac Office. To be blunt, Microsoft threatened to refuse to sell a profitable product to Apple, a product in whose development Microsoft had invested substantial resources, and which was virtually ready for shipment. Not only would this ploy have wasted sunk costs and sacrificed substantial profit, it also would have damaged Microsoft's goodwill among Apple's customers, whom Microsoft had led to expect a new version of Mac Office. The predominant reason Microsoft was prepared to make this sacrifice, and the sole reason that it required Apple to make Internet Explorer its default browser and restricted Apple's freedom to feature and promote non-Microsoft browsing software, was to protect the applications barrier to entry. More specifically, the requirements and

restrictions relating to browsing software were intended to raise Internet Explorer's usage share, to lower Navigator's share, and more broadly to demonstrate to important observers (including consumer, developers, industry participants, and investors) that Navigator's success had crested. Had Microsoft's only interest in developing the Mac OS version of Internet Explorer been to enable organizational customers using multiple PC operating-system products to standardize on one user interface for Web browsing, Microsoft would not have extracted from Apple the commitment to make Internet Explorer the default browser or imposed restrictions on its use and promotion of Navigator.

356. Microsoft understands that PC users tend to use the browsing software that comes pre-installed on their machines, particularly when conspicuous means of easy access appear on the PC desktop. By guaranteeing that Internet Explorer is the default browsing software on the Mac OS, by relegating Navigator to less favorable placement, by requiring Navigator's exclusion from the default installation for the Mac OS 8.5 upgrade, and by otherwise limiting Apple's promotion of Navigator, Microsoft has ensured that most users of the Mac OS will use Internet Explorer and not Navigator. Although the number of Mac OS users is very small compared to the Windows installed base, the Mac OS is nevertheless the most important consumer-oriented operating system product next to Windows. Navigator needed high usage share among Mac OS users if it was ever to enable the development of a substantial body of cross-platform software not dependent on Windows. By extracting from Apple terms that significantly diminished the usage of Navigator on the Mac OS, Microsoft severely sabotaged Navigator's potential to weaken the applications barrier to entry.

Good day eh, Like what are you talkin about eh? Can't brew beer? Perhaps you didn't have any backbacon to go with it? Really we can brew beer. The thing is that we like our beer cold. Perhaps you like your beer warm because all your fridges were made by LUCAS, the PRINCE OF DARKNESS.
LUCAS the inventor of the Electrical Short:-).

Just having off topic fun. But really it is the United States that has a difficult time brewing beer. They soon resorted to putting water in a can and telling their consumers it is beer.

Later Brian.

These discussion of bloated software vs technology isn't so clear cut. I
think you have rested your case to soon, and therefore shall not be allowed
a rebuttle:-).

My ST let alone my TT and Falcon can outperform a PC in certain respects.
The argument would be similar to yours. An Amiga could make a similar
```

Claim.

But this has little to do with current technology. Object rendering is something that requires horsepower, and you can never have to much.

While I haven't seen it myself, apparently the speed of Atari software on PC emulators and on Magic Mac is Very Fast.

The ST and Falcons are like sportscars to me. Great handling poor horsepower. And in a race handling is always superior to horsepower. But one always respects power.

I would love to have a 500mhz ST:-). But I am very comfortable with my ST or my falcon for internet activity and when using NEWsie there is little difference. Probably would be similar if I were using Pine.

The 68000 Technology is not necessarily outdated as it performs adequately. But that doesn't mean that if more power were offered, Atari Users wouldn't grasp at the opportunity.

As for me a Graphic Card and Ethernet adapter for my TT would suffice:-).

Later Brian.

Hi Brian

Since we used to have a lot of Ford cars made in England here in Sweden,
fitted with Lucas generators, we have a saying that goes something like
this.   "The man who invented darkness, Lucas".

Yes this is an Atari newsgroup, but you will see a LOT of drivel
about Micro$loth and Apple. Usually this is because few people
have enough 'dirt' to really get stuck into the Atari platform.

It is after all an advocacy newsgroup, which apparently gives PC and Mac users free reign to try and stick it Atari issues. It also gives Atari users free reign to forward rebuttal on said issues, and give a bit in return over Mac/PC issues... ;^)

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

seeing as I know many Atarians making good use of their STs day-to-day, and having witnessed how Amigans are just as productive, you are correct in that accessment.

I can vouch for it - I went to Joe Connor's house on one of my UK visits and he showed me his Powerbook/Duo Dock setup running under MagiCMac - really stable and quite fast (he was using it to produce Atari Computing literally in-house at that point). DA's Layout and Papyrus literally screamed.

that's the thing regarding the ST - many people said that STs were too old, slow and archaic to properly access the Internet. And then Alexander Clauss, Dan Ackerman and the other guy went and came up with STiK, CAB and the CAB.OVL.

That's the great thing about Atari, be told that Atarians can't do it, and then do it and ask them if they want their crow boiled or fried :)

>
> The 68000 Technology is not necessarily outdated as it performs adequately.

I thought it was interesting to find out that the Palm Pilot actually uses a 68000 processor at its core - amazing what "yester-decade technology" can still do...

> But that doesn't mean that if more power were offered, Atari Users wouldn't grasp at the opportunity.

you'd bet I would! :)

>
> As for me a Graphic Card and Ethernet adapter for my TT would suffice:-).

I'm currently looking at possibly going for a used PowerComputing machine as my main computer, that and MagiCMac look out! But I'm still keeping the Falcon for MIDI and as a backup for my Internet use should the Mac go down.

Of course, things could change - if I go on another UK trip next year, I'll check into System Solutions and get me one of those new Milans in kit form if I'm sufficiently impressed :)

Would?  How many years has the Hades been available?  The Milan?
Those souped up STs already exist, so why aren't you buying?

> I'll check into System Solutions and get me one of those new
> Milans in kit form if I'm sufficiently impressed :)

You could already do it, based on other people's reports....

TIFKAS, are you are a childish moron who only gets satisfaction from making light of the choices of others? Are you as small of a person as you appear to be?!?

Pretty much ANYONE with any need to "evangelize" a computer platform of ANY kind is silly in my view. It's just a tool.. it's not something important, like a spiritual awakening, a sunset, the birth of a child, creating a work of art, etc.

Your petty, childish, immature "evangelism" cannot make up for what may or may not be missing in your life, so stop trying.. stop using your choice of computer platform as your security blanket and frame of reference.

People see right through your apparent attempt to feel superior by denigrating the choices of others... grow up, buddy. It's time to move on

now.

-Mark

you know, I agree with that. Actually, I would've donated that Mac Colour Classic to a school had I gotten my hands on it.

Of course, TiFKAS takes this tragedy and tries to tar Atari users - who he likens to murderous extremists - with the same brush. I'm sure that if it were an Atari Transputer that was given the torch and drill treatment those cretins (who, BTW, gave no idea what platform they support - Wintroll, anyone?) applied to the Classic, he'd be drooling and shouting out with glee "gee, one more useless Atari computer gone"....

The Palm OS has 80% marketshare in the handheld market. Even some of the
WinCE makers are giving up.

Lets see...APPL stock is at $88 from Friday's session with a $4 gain.
Plus AAPL $12 million investment that translates into a 5% holding in
Akamai is worth $600 million! Andrew Neff has upgraded AAPL stock target
price for the umteenth time this year...

I feel for that women wo was on the cover on Money magazine some months
ago for being conned by her (ex?)boyfriend for blowing 30 grand into
Atari and cashing out at below $1000. Only a Jim Jones Jihad could of
done that..

The price point is a figment of your imagination...Macs are cheap today
in price....You should be worrying about the Milan price..

I suspect 'Chunks' is still suspicious of the Milan.. I mean being one of
the tens to buy one with near zero developer support...Thats why he uses
a Mac more everyday and intentionally hyped his legacy TOS boxes up..

Never had a hotmail account? CC'ing a post is harrassment? Losing an
argument, you take the radical feminist way out..Have had PCorrectness
clash experience. Gosh folks are too babyish today..

>   Like I said, I don't threaten - I make promises which I intend to keep.

Such as...?

It's a shame this stuff is going to waste. I just don't use it anymore.

SEAGATE ST-157N (45 Meg) SCSI HD	$10
MAXTOR XT-8380S (380 MB) SCSI HD	$50
SC-1224 Color Monitor (Minus Vid. cable)	$60
Golden Image Hand Scanner (4", mono) with Scanning tray	$60

I'm in Florida in the USA, and buyer must pay shipping. If interested in any item, let me know where you are and I'll check into the mailing cost.

HELLLLLLLOOOOOO SILLCLAP?! NOBODY HOME?

How many times do I have to say it?

average PC	3000 FIM
Milan	4500 FIM
iMac 350	8000 FIM

Sorry, I don't call that a "cheap" iMac.

Until Jobs does what his ancestral pantronym tells him to and
price it right, iMac it will not be, for me.

I bet 'Chunks' will begin making calls to dispute this..

Mac Shortages Widespread Globally

Friday, November 5, 1999

By Applelinks Contributing Editor Charles W. Moore

I received a note yesterday from fellow Nova Scotian reader Waye Mason, who asked:

> "Have you noticed that Innovative Systems and Atlantis Kobetek [the latter are both prominant N.S. Apple authorized resellers] AND MacWarehouse [currently the sole national mail order Mac reseller] have no Macs to sell in Canada? This concerns me deeply. Atlantis and Innovative have NO computers of ANY KIND to sell, and have not for 2 weeks! With your network, do you know if this is the case in the US, overseas, in the rest of Canada?"

Well, last week it was reported that the reseller channels are empty in Sweden and the U.K. too, except for some high-end PowerBooks. However, this is a moving target. There are reports from dealers across Canada that a few new iMac DVs have been trickling in.

I contacted Peter Gnemmi, the president of one of the Nova Scotia resellers Waye Mason mentioned -- Atlantis Kobetek Inc. -- to get his perspective on this issue. Peter told me that Atlantis has had recent delivery of a couple of iMac DVs and a couple of PowerBooks. He says that G4s are pretty easy to get, that 350 Mhz iMacs are currently impossible to find even in the US., but that he is getting getting a "whole pile" of iMac DVs in next week.

Update: One of the Mac Websites yesterday reported that the $999 entry-level 350 MHz iMacs are just now beginning to enter the US distribution channels.

It seems that product shortages are beleaguering Apple resellers all over. Yesterday, AisaBizTech reported that Apple Japan is also being plagued by product deliver delays.

While Apple Japan had expected to announce three new iMac models on Oct. 16, the release had to be delayed due to lack of product availability, and iBook supplies are thin on the ground as well.

"We have already received orders for about 450 [iBook] units, but only 45 units have been shipped," a spokesman of reseller Joshin Denki Co., Ltd. told AsiaBizTech.

This constipation in the channels plus the fact that Apple Japan has reportedly squeezed retailers' margins on systems from 10 percent or more down to just 6 percent to 7 percent, is not a formula for happy campers in the retail community, although AsiaBizTech reports that "Retailers generally support [Apple's] distribution and sales system."

Back in Canada, a member of the Mac-Can email list who works for iPoint Computing, an Apple reseller in Montreal, notes that his firm received 4 new iMacs so far on Monday.

However, when I called MacWarehouse Canada a few minutes before this article was posted, I was told that there are no iBooks and no iMacs (either second generation units or leftover Revision Ds) in stock. When would they be available? "Likely in a couple of weeks." Did MacWarehouse Canada have any computers at all for sale? "A few 350 MHz G4s." I was told. I imagine that MacWarehouse is just as steamed about this as are Canadian Mac consumers.

     VERY MUCH SO.

     Especially on machines as overpriced as
     Apple's have always tended to be. ATI
     survives much like Microsoft because it
     shoves crap down people's throats through
     the OEM channels. In any vidcard generation,
     it's always at the trailing edge of the pack.

>in price....You should be worrying about the Milan price..

     Cheap is always relative. As always, for any given level
     of functionality the Apple's are more expensive. Without
     SCSI to change the balance of things, this is really quite
     pathetic.

     These days, the Apple's are little more than PC Kludge Klones
     with PPC cpu's on the mainboard rather than fast 386's.

knew that TiFKAS would try that again - and again, as I pointed out,
the Montreal Gazette also did not do their homework.

It depends on
> your diffinition of sold out.. iMacs in Apple's warehouse and
> distribution channel were flushed out.

first, it's spelled "definition". secondly, according to my brother,
Apple still had lots of 233mHZ Rev. B iMacs in stock during the whole of
March - unlike you, my brother has direct access to Apple's warehouse in
Cupertino and knows what is in stock.

Stores did have very low stocks
> at the time...

BZZT! Wrong! In Toronto there was a veritable glut of them during the
"sold out" period, and many stores still had Rev Bs, which they were
trying to blow out at greatly reduced prices - indeed, a Computer City
employee told me that the articles were "greatly overstated".

>

gee, ask Benjamin Netanyahu - he was on record today that Canada is
doing "extremely well" when he came to visit today. And we're doing well
enough that our Prime Minister announced today that he's putting in new
investment in our universities and sciences, and mentioned that there's
going to be some major tax cuts. Hardly the actions of a country having a
rough economic time. You should try reading real newspapers instead of
kissing Tubby's butt to try to cover the fact you picked the wrong
newspaper to base your groundless claims on....

no, more vote-splitting between the two opposition parties - the Tories actually lost the popular vote. Of course, Harris had to use dirty US-type politics to paint the opposition leader as the provincial boogeyman...

>

> columinists take on the sorry state of the Hollywood's back lot economic
> situation..

first, it's spelled "columnist". Time to re-attend remedial first grade.

secondly, "Hollywood backlot up north!" ROTFLMAO! got news for you, TiFKAS - the Canadian movie industry is a separate concern that is doing so well that the Hollywood community is actually trying to get its actors, cameramen, etc. to not go to Canada to work, because it's actually draining dollars from the US film industry! May I also tell you we have some of the most powerful and influential companies in the entertainment industry like Nelvana, Mainframe, and Alliance-Atlantis (does the words "Roberto Benigni", LIFE IS BEAUTIFUL and "Oscars for best picture and best actor" ring any bells?)

thirdly, any search for your steaming piles of drivel on Dejanews will uncover scores of times you've attacked Canada as a last resort when it was obvious you were losing a debate, including calling it "the northern US territory" - you've done the same to New Zealand with your drooling jingoism when Chris nailed you to the wall. Another attempt by TiFKAS to rewrite his own history?

>

> > Note too that he's not bragging about Jesse "The Baby" Ventura anymore

> surplus a sales tax and renter's property tax refund? I missed out since
> I moved last Nov. Were for the '97' filers....I should get back $600
> for'98' and $1000+ for '99'..

again, TiFKAS - the average person on the street thinks Jesse "The Baby" Ventura is an overgrown infant who is a laughingstock as a politician. And may we now add "bigot" and "idiot" after last weekend's revelations about that interview.

and as for your economic forecasts - telling a lie over and over doesn't make it true. It's not working for Tubby, and it's never worked for you....

In the paragraph you conveniently snipped in this reply. A search of DejaNews will also reveal you also called older Macs like IIcis "junk" as well....

`The Q 950 was a saliva dream machine way back
> then...But time progresses..

yet a Quadra 950 is still infinitely useful, especially in grinding pathetic losers like TiFKAS to chutney with his own words...

>

> cabbies...Ring a bell?

does THIS ring a bell, TiFKAS? In a recent MacAddict, a reader said he was about to order a new product from a company when he noticed a spelling mistake in the ad - and he figured, if they caouldn't even get their ad right, why bother? The same when dealing with you.

>

> court. The economic indicators are not state secrets...

because I actually went and looked, chucklehead. I called the stores. THERE WERE PLENTY OF iMACS FOR SALE THROUGHOUT THE MONTH OF MARCH. It was obvious that the article was based more on an Apple press release than the reporter actually doing legwork...

> > >
> > > Much of the Fry's are in California. You will not get much for $25,000 a

> in Calif..

uh, TiFKAS - $8 per hour x 40 hrs per week x 52 weeks = $16,640 gross income per annum, a shortfall of at least $8,360 of what you claim - did we not forget things like employment insurance, taxes, pensions, etc.? That certainly whittles down the take-home pay....

wage rate in California? most likely the same across the board all across the US.

this economic report brought to you by iCalc, now in 68k :)

>
> I am not a proffessional? How do you know...? Do you know me? Are you
> a professional?

I know you well enough to know you certainly don't ACT professional.
You can't even SPELL professional.

I am professional, and take great pride in being so at my work.

any search of DejaNews will give you that Joe is a superlative writer, thoughtful, and has experience in retail - a similar search on DejaNews will reveal that you are a clodhopper who not only can't spell, but also constantly tries to rewrite his own history as well as having his breath smell like shoe polish when he's not trying to extricate his head from his ass.....

nope - YOU made the claim, YOU provide the evidence. That's how debate works, pinhead - which is why you've lost so many of them, especially to guys like Particle Salad....

Maybe YOU should visit your own poorly-funded library, I guarantee that they have all the info you need. But then, seeing as your reading comprehension is around the level of Pat The Bunny....

You sound like that Macs and wintel boxes cost an arm and a leg...

> My point is that many users just want to type emails and letters...owning
> a brand new fast Mac, PC, or Milan060, will not help them create these
> kind of documents dramatically faster than say a 68030 Mac or 486 PC...

Depends what kind of apps your using. I need the best because my job
demands it. I use PP, word and excel....so I need decent hardware..10
year old macs and pc's will not do it..

I can attest that I would never want to create another document again on
a 68030 Mac. I can't run Word 98 on that Mac..

Here in the U.S. the new $999 iMac can be had for $599 if you sign up for
a Compuserve three year sign up.. The specs for this BB/350 are:

350-MHz G3 processor with a 100-MHz system bus, a RAGE 128/AGP 2X
graphics processor, 64MB of RAM, a 6GB hard drive, two USB ports and a
56-Kbps V.90 internal modem. It will also feature optional AirPort
wireless networking capabilities. Plus the speakers are Harmon Karden, a
nice touch..

> The answer almost surely is NO! Unless of course you've gotten real good
> at typing...

On the older boxes...Would have to wait for the cursor to catch up..Plus
my software would not run off it..

> I aim to have a Milan with 060 sharing a big SCSI disk (bus arbitration)

> since has been sold out..

and, as I pointed out, the articles were WRONG. I found many of the iMac YUCKs in stock. At the Computer City where the employee said the Tubby article was GREATLY OVERSTATED, they had ALL the colours in plentiful stock. Rev Bs were also in plentiful stock. We are talking about what was going on THEN, not NOW.

the fact is that the article claimed that the fruit-flavoured iMacs were sold out or in short supply in Canada in March. My research proved different. Or does the Tubby not consider Toronto a part of Canada?

nope. When Harris resorted to "boogeyman" attack ads againts the Liberal opposition leader MONTHS before the election was called, I would call that sort of behaviour unfair.

Besides, like I said, Harris lost a lot in this election - many of his key cabinet ministers, the ones who made all the bone-headed decisions regarding unions, education, welfare, were soundly defeated. And Gerrard Kennedy - Harris' biggest critic - was re-elected in a landslide after Harris tried to parachute a former Liberal into the riding to try to defeat him. Not to mention Harris wound up losing his wife a month ago, in part to his infamous temper and bullying tactics, and in part to the fact that Janet didn't want him as premier again...

>
> Does the X-Files ring a bell?

The X-Files stopped production in Vancouver because David Duchovny was homesick for LA and his wife and pressured Chris Carter to move the show to Hollywood. The decision had NOTHING to do with Canada's economy. This was in all the papers and news reports up here. Duchovny himself says he has nothing against Vancouver or British Columbia, and thinks it is beautiful country up here.

Really, is that the best you can do, TiFKAS?

sorry, we don't have drooling dragging-their-knuckles cretins with negative IQs in Ontario, that's why the Reform Party got skunked in the last federal election :)

there's a big difference between disagreeing and being a bigot, TiFKAS. For your information, I've done my own work in fighting against bigotry in Canada for many years, including against Catholic-haters, Nazis, and gays. I've even refused to serve customers who made ethic slurs against my co-workers (with the support of my bosses, BTW). Compare this to Mike Harris, who once compared a legitimate protest to an Iranian Jihad (sound familiar, TiFKAS?) and was forced to apologize to the Iranian community and the protestors.

Your claiming that I'm a bigot shows that you've now hit an all-time low, TiFKAS. And your trying to white-wash Jesse Ventura's unacceptable and brain-dead slurs shows that you have some issues that deeply need to be tended to. Maybe they should round up all the bigots, and send them back to bigot-land from whence they came? :)

> Curmudgeon does not agree with you and sides with your Tubby.

strangely enough, TiFKAS, the low dollar we've learned to live with quite nicely. Thanks to it, we're enjoying high export levels, our tourism industry is way up, and many car plants have been put up by the Big Three and Japanese firms because it's cheaper to produce cars here. In fact, American tourism is hurting so bad that Texas and, recently, Pennsylvania announced campaigns to tourists from Canada to visit their states and -get this- they're so desparate they're going to accept our money AT PAR.

I'm sure that the Curmudgeon will have his own take on the idiocy of Conrad "Tubby" Black....

in the case of TiFKAS, after reading one of his brain-dead and inaccurate posts, two words come to mind - CAVEAT EMPTOR.

Actually - I don't read either the Glob & Mule (far too
Torontocentric) or the National Post (too inconsistent) - so I don't
agree with either of them - like most Westerners - I think for myself !!!

Or as one wag puts it "There are 12,000,000 sheep in Ontario. The
trouble is, 9,000,000 of them think they are people."

and who will soon regret saying that if he decides to run for President. Could you imagine how Ventura will react when his opponent dredges that back up in a debate? That won't go over very well in the Bible Belt, fer sure -

<Church Lady mode ON>

what inspired Ventura to put his foot in his mouth like that, could it possibly, yes could it possibly be (reverb on) SATAN? (/reverb off).

<Church Lady mode OFF>

thanks for confirming that even you think that the Daily Tubby isn't even good enough to line budgie cages with. More answers in the form of a question in the new Jeopardy category, "Things Sinclap Doesn't Know What The Hell He's Talking About" :)

Here in Toronto we refer to the Globe as the Glib & Flail.

Personally I prefer the Toronto Star, they're not afraid to pull punches. And the Sun gets in some great stuff, that is as long as they're not brown-nosing themselves to Harris.

And let's not forget Frank! They're the thorn in the side of everyone, especially "Tubby" Black. One thing I wonder is how Frank managed to find that picture of TiFKAS for their subscription ads - I guess TiFKAS didn't see the cameraman, seeing as he had his head buried in, ah, a "prone position" at the time...

>
> Or as one wag puts it "There are 12,000,000 sheep in Ontario. The
> trouble is, 9,000,000 of them think they are people."

and I am, as a famous Monty Python sketch put it, one of the most dangerous things in the world: a clever sheep :)

BTW, that's a good one. Did Rick Mercer come up with that?
>
> The Canadian Curmudgeon (in a liberal free zone, Calgary)

and I'm posting from cold, clear, Conservative-free Toronto ;)

Hi, I have 5 Atari items for sale. To make things fair for everyone,
I posted them on E-bay, so that everyone will have a fair chance.

Here's the stuff:

Atari Computer Power Supply, +5v, -12v, +12v
Atari Replacement ST Keyboard, BRAND NEW!!!
Atari "Side Board" for 810 computer NEW!!
Atari Power Adaptor Part No: C018187 11.5vdc
Atari 9 Volt AC Supply Part No: C017945

Go to this shortcut to get to my e-bay items.

http://www.elpro.com/img/

All of this stuff is in new or like new condition. Power supplies have been tested.

Good luck.

Uh.. HELLO?!? I don't work for Avid.. I have FCP and Xpress Mac.. I don't care which system I use. Why would I give a damn?

My only issue is with morons like you who pretend FCP, right now, is impacting Avid's business.

Hi there,

sinclap wrote:
>
> You sound like that Macs and wintel boxes cost an arm and a leg...

No I don't. You are sideskipping the issue, which is about whether average email sending, letter typing PC or Mac owners really do need a fast machine just to accomplish these -oh so heavy- tasks...

PC's and Macs are cheaper than ever...which is completely unable to be contradicted...

> > My point is that many users just want to type emails and letters...owning
> > a brand new fast Mac, PC, or Milan060, will not help them create these
> > kind of documents dramatically faster than say a 68030 Mac or 486 PC...

> Depends what kind of apps your using. I need the best because my job
> demands it. I use PP, word and excel....so I need decent hardware..10
> year old macs and pc's will not do it..

It is your job, and having come from a corporate oriented company that demanded much from me, yes the best is the only standard I'd be expected to adhere to. But a novice home user isn't under such pressure. My partner is completing a diploma which includes computer content (she's a real PC novice), and the lecturer suggested she buy a PC to keep her PC skills up once the course of study was complete, but he gave a card leading her to a retailer who would have sold her a US$1250 Pentium III system with 64MB RAM, ATI Rage II graphics etc...all she needs is a basic machine with which to hone the skills she learnt on the course. A basic older Pentium with Win95 and Word 6 would suffice...second hand probably. She has no interest in games or graphics apps, so why should she waste the best part of US$1250 when she could get a working machine 2nd hand for about $200?

> On the older boxes...Would have to wait for the cursor to catch up..Plus
> my software would not run off it..

Thats only if you try to run newer software. Older versions of the same
software, as I have said, would suffice for many...

> > I aim to have a Milan with 060 sharing a big SCSI disk (bus arbitration)

> > video out...a nice budget video titling setup...
>
> How about the cheaper iMac DV set up that includes iMovie?

Then I couldn't run APEX media, or D2D software I'm familiar with!
I'm not interested in going into business here...just in making a
title or two for some of my holiday videos...

BTW, with your knowledge of macs, do you know of a mac app that will play
16-bit FLIC animations (.FLH) as created by Autodesk Animator and APEX
media?

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

There is a movie called "DELUSION" that came out around 1991. It features an
Atari Stacy as a new computer design that will "revolutionize the industry".
And also in the film, on the lead character's desk is an ST. And of course

Atari Corporation is credited at the end for supplying all computers in the film.

And the movie is pretty good as well. It was released by a company called CINEVILLE. You might be able to find it at your local video store if you look hard enough.

found at comp.sys.mac.advocacy:

many times, The iDiot Forever Known As Sinclap has crowed over and over that Microsoft was not afraid of Linux encroaching in their territory despite its growing popularity.

Well, looks like TiFKAS is about ready to choke down a whole bowl of his much-hated strained spinach, judging by the FUD being put out by Microsoft about Linux. And well they should try a pre-emptive strike, seeing as how well Red Hat is doing both on the stock market and in sales against Windows NT in the server market. Indeed, Red Hat actually OUTSOLD NT in July.

yes folks, Microsoft IS scared about Linux.

(insert picture of Bill Gates yelling "sweet merciful crap!").

Please also note that nice things were said about Macintosh - shows you that I am an equal opportunity OS user :)

At first I just kept this note as a reply in its original lists. But then I say crap like this being foisted on folks:

"Summary The Linux operating system is not suitable for mainstream usage by business or home users."

This is a quote from Norman D. Megill (ndm@shore.net) in his moronic note "Microsoft shatters Linux myths." This line is a DIRECT QUOTE he lifted from the Megalosoft site listed below. In fact you will find it at the end of the full quotation I have provided here.

Permit me Norm to shatter YOUR myths:

Michael Wicklund <tbogard1@MYhome.com> wrote in message
news:37FECCB5.44073BEB@MYhome.com...
> I think this is old but it's worth the attention. Check it out:

>
> It seems that Micro$oft is afraid of Linux.

| Summary
| The Linux operating system is not suitable for
| mainstream usage by business or home users.
| Today with Windows NT 4.0, customers can be
| confident in delivering applications that are
| scalable, secure, and reliable--yet cost
| effective to deploy and manage. Linux clearly
| has a long way to go to be competitive with
| Windows NT 4.0. With the release of the Windows
| 2000 operating system, Microsoft extends the
| technical superiority of the platform even
| further ensuring that customers can deliver
| the next generation applications to solve their
| business challenges.

Let's sort out a few things simply reviewing the inane summary Megalosoft give us here:

1) Windows NT is NOT scalable in the conventional sense. Once you hit 25

machines on a network its toasted. This figure was determined by InfoWorld magazine. STUPID Eastman Kodak believed this total drivel from Megalosoft and vowed to have all of the company, worldwide, moved over the NT 4 by October of 1996. Megalosoft provided on-site staff to assist in the change. It never happened. Kodak gave up and went back to a backbone of, guess what, UNIX. Nice Lie Megalosoft.

2) Windows NT is NOT secure. Every single week a new Megalosoft security bug is revealed. They show up in every application that uses their horrifying macro language. They show up in their eMail programs. They show up in their browser. And lord help you if you haven't noticed that they show up regularly in Window NT. This week a new NT security hole was found, and this is AFTER 5 (F-I-V-E) service packs. The US Army got so fed up with the security failings of Windows NT on their webserver that they switched over to Mac OS using WebStar. Again: Nice Lie Megalosoft.

3) Windows NT is NOT reliable. Validated reports have proven that the failure of NT in the Navy has left at least one of their ships dead-in-the-water. InfoWorld recommend bringing down NT servers every weekend so as to avoid unexpected crashes. The average uptime for NT 4 is less than two weeks. Yet again: Nice Lie Megalosoft.

4) It has been shown the Megalosoft LIED when they said their Windows 2000 server was hit by lightening or suffered power transients during their security tests on the web. What flatout happened was the OS was so unstable that they could not keep it running. So much for hopes of improvement in the next generation of Windows. But I am sure we will hear further Nices Lies from Megalosoft to the contrary.

5) Business has already proven itself to be horrendously computer illiterate. Statistics have PROVEN that if businesses were based on Macintosh computers instead they could cut their costs of computer setup, training and support by a factor of 4, according to INTEL! Johnson and Johnson watched their computer install, training and support budget balloon by a factor of 10X (T-E-N T-I-M-E-S-!) when they switched from Macintosh to PC. Shoot yourself in the head! Nice work!

6) NT is a Megalosoft failed attempt to bring UNIX to the PC under the Megalosoft brand name and accompanying profits. It is THAT SIMPLE. And here they are LYING about how poor UNIX is (AKA Linux!!!!) when they are in fact suffering from UNIX ENVY! It is all too hilarious.

Next time you believe what Megalosoft tell you:

Go have some tea, take your Lithium, get a good night's sleep, and everything will be better in the morning. Just keep telling yourself where you DON'T want to go today: Insane.

Does anyone use a hard drive compression utility similar to those found in the PC world? My 40 meg HD on my Stacy 4 is getting pretty full. If there are shareware or freeware ones out there that would be great. I think there was a commercial program written by Oregon Research but I'm not sure where I'd get it or what it was called.

Thats pretty f**ked up drivel. I sadly see this in MOST PC magazines these days. What a bunch of corporate kiss-ass f**kwits. I am certain that these guys are either tripping on bad acid, or Micro$loth are reaching into their pockets to 'support' this drivel. These journos are probably under contractual obligation to NOT say anything bad about NT, even though that means they'd be lying...

Linux network installation companies are sprouting like spring flowers in southern hemisphere October when I read the daily newspaper here. I haven't seen as many NT network 'experts' extolling their 'superior' support in the ads recently either...this is the beginning of the end for NT based networking, as finally businesses have the choice to make as to networking solutions. That choice is no longer NT...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

My Mac spec...likes the new iMac....

Always a bridesmaid, but never a bride: hands-on with iMac
DV SE
Special to theiMac.com by Rodney O. Lain
10/10/1999 - Rodney O. Lain

"Sweeeeeet."

-- Eric Cartman, "South Park"

I don't own an iMac, let me make that clear. So, how can I write about it, then?

Well, the reason I'm in no rush to buy one is because I get to play with them whenever I want,
for as long as I want

And tonight, I wanted to.

Out of the box

I went into the CompUSA tonight (Friday) to set up one a G4 display. We were also to set up the
iBook demo machine, but couldn't since we didn't have any in stock. I was surprised to find a

good number of customers milling around the Mac section. One lady wanted to see one of the new iMacs, so I suggested that I could bring one out, since I just saw that we had several of the iMac DVs and DV SE's in stock.

"Oh, you don't have to do it for me," she countered.

"Oh, I'm not," I replied. "I'm doing it for me."

She wasn't offended. She smiled, understanding my excitement. (By the way, I don't normally speak so straightforwardly with every customer, but most Mac customers are more relaxed and more willing to laugh and share in my giddiness.)

Anyway, as the Apple rep (who suggested that we set up the demos) dealt with arranging the B/W G3 towers (to the back of the section) and setting up the G4 demo (at the front of the Apple store), I went to grab an iMac.

Decisions, decisions. Should I get an blueberry or an graphite machine? Graphite, yes.

Upon opening the box, I could tell that Apple took as much care at packaging and packing the product as creating it. Clear, shrink-wrap plastic covered the iMac's handle, monitor and other vital parts. I unwrapped it and pulled it out, noticing immediately that it really is lighter than the previous iMacs -- and I should know, for I've carried my share.

There was a crowd, so I didn't rush setting it up. We each took turns fondling the iMac as we casually talked about the Mac, Apple's comeback, etc. I overheard an Epson rep marvel that Apple's marketshare doubled by with the iMac alone. The Canon rep asked if she could demo their new all-in-one machine tomorrow. One customer worried aloud about Apple's ability to supply the iMac channels adequately. I reassured him that we'd have plenty iMacs, it being the company's cashcow and all. He was pleased that the Mac section had such confident and Mac-knowledgeable people, to which I said, "Aw, shucks�"

I plugged in the power cable and turned on the iMac. I intentionally didn't plug in the mouse and keyboard so the customers could see me plugging them in after turning the power on� Ah the user-friendliness of USB!

I inspected the iMac. Did you know that you do not need the paperclip anymore? I said aloud. The iMac now has the reset buttons (near the USB and FireWire ports) just like the B/W G3 has. Now, I could have just overlooked the pinholes, but it would be redundant now, right?

I noticed that there was no door covering the ports (USB, FireWire, ethernet, etc.) like on previous models. I inspected the back door where you access the RAM slots, but didn't open it (must save something for tomorrow).

Next, I pulled out the DVD copy of "A Bug's Life" that came with the iMac. I installed it and noticed that it was DVD ran on version 2.0b4 (or something like that) of the DVD software. Turing the movie, I was pleased that the speakers sound so much better than the previously tinny ones. Even so, I still plugged in a set of Cozo speakers. I inserted and ejected the disk several times to see how the front-loading slot worked. Sweet.

I then installed iMovie, the digital-video-editing software that comes with the iMac. After that, I went to help a customer, and when I got back, one of my friends had a crowd around him. He was amazed at how easy to use the software was. I'd installed the 160 MB iMovie demo files that he was using. He'd edited a video about a dog and a family by adding a transition to two scenes. Without a manual. We noticed that the application only plays with Digital Video -- in other words -- only for FireWire equipped Macs. We figured that all FireWire-equipped Macs will come with the program in the future, then.

Personally, I think the graphite color was too transluscent (and a customer agreed with me). I mean, you could see virtually every part of the computer's innards. Ironically, it was also cool at the same time. I can't quite explain it. I noticed on the boxes (which have new artwork, also) that the other iMacs appeared to be not as transluscent as the graphite-colored one.

To be honest, I'd have a hard time deciding which one to buy.

Overall, the machines are works of art -- moreso than the original iMacs. I think Apple will sell far more of these than the previous models. And I honestly believe that each of them is a big deal for the money -- even the high-end iMac DV SE. The Wintel world erroneously believes that the secret to iMac's success is merely color (take a look at the eOne when you get a chance -- I did was not impressed at all). The iMac is a total package; a totally integrated package. This is not Apple cheerleading. I went and looked at the PCs in the store and the Apple lineup beats them all, hands down.

Now, I could have given you a more formal, "professional" review of the iMac. But it doesn't take formality to tell you that you should buy one of these beauties if you are on the market for a new computer.

The current crop of iMacs are the Macs that most of us were waiting on, back when we felt that something was missing from the iMac. You won't have that feeling after test driving one this go round.

Proof, pudding, eating

As I set up the iMac, one customer who was there for a while, talking and watching, decided to buy one. I went to get a blueberry model for him "for his daughter's birthday" on October 26 (remember that today is October 8). I joked that his holding the computer that long would be like the fat kid being assigned to watch the candy stash, suggesting that he'd "play with" the iMac so much before giving it to his daughter that it would no longer look new. After some thought, he decided not to buy the iMac that I'd brought out for him. So I took it back -- and I brought out the graphite iMac, per his suggestion. I wonder if it is still "for his daughter."

It was a great night. We spent more time than we'd planned playing around with the iMac and the G4 (which is a story for another column unto itself). Technolust reigned supreme.

Oh, and remember that comment at the beginning about not being in a rush to buy an iMac? That is no longer true. Because now that I've played with it myself, all I can say is one word: "sweeeeeet."

Unless you are on the WWW it does. Not all will wait five minutes to
wait for a page to load.

> PC's and Macs are cheaper than ever...which is completely unable
> to be contradicted...

Many will surf the web. Lets face it, the web has changes society on how
we function. If you think the Atari 8 bit will be all you need...I have
a bridge to sell..

> > Depends what kind of apps your using. I need the best because my job

She is going to need to allocate upto $1000 for a decent system and that
would not be unreasonable. Even Apple has an official $999 iMac now and
that includes 64 MB, 6 G's, 128 Rage/2x AGP and a nice software bundle.

This post only proves the fact that iMac's are aimed at the newbie and bubblegum market. Not a bad market to aim for though, there are a lot of clueless people around.

FYI, the USB design patents lists the Amiga A4000 hardware manual as a reference. Hmmm, go figure.

Gee, they finally figure out how to properly implement a true plug 'n' play technology and they needed to research an old Amiga manual to do it...

Why doesn't that surprise some of us...

Regards,

Clockmeister.

Page formatting speed isn't that much of an issue. The speed at which
the data comes down the line is more often the deciding issue. Most
people use 56k modems, and traffic can make the some of the bandwidth
available in a 56k redundant at times...

> Many will surf the web. Lets face it, the web has changes society on how
> we function. If you think the Atari 8 bit will be all you need...I have
> a bridge to sell..

These societal changes you speak of are not as all consuming as -MOST-
web users would admit they are. Sure we email other people, and surf
the web, but people don't function much differently from what they did
10 years ago or 20 years ago...they just send email instead of writing
letters...

iMacs are quite expensive here ($2999NZD, equates to $1550 but with a low-spec
printer as well), and PC's, while cheaper, are tending NOT to be bundled with
a full suite of Word, Excel, etc...

She doesn't want to pay that much money for a computer, and then have to pay
quite a bit more to get the software...as I said an older Pentium with 14-15"
screen, 133-200Mhz CPU, 16-32MB RAM, and Win95, with Word95 and Excel95
can be
had for US$200 here...why should she want more?

> For you and not the millions who have home offices such as myself..Quit
> assuming that you know whats best for all.

I'm well aware whats best for all. For a busy home office a system that is quick and easy to use, as well as reasonably capable, is the ticket. For a novice home user like my partner, who isn't using her system to run a business , a slower 2nd-hand machine is fine. For myself, a combination of my Falcon030 and a 200Mhz PowerMac is more than suitable, especially the Falcon, as my computing interests are not the mainstream business apps I see most people struggling with in the home environment, but 'fun' software like APEX media. I also use Adobe/Epson ColorIt!, Photoslop, D2D software (mainly on Falcon!, 200Mhz 603e doesn't really cut it for D2D!), and the odd game demo. I cannot be bothered to buy games because I don't really get enough time to play them fully. So sorry, I don't quit now...

> > BTW, with your knowledge of macs, do you know of a mac app that will play
> > 16-bit FLIC animations (.FLH) as created by Autodesk Animator and APEX
> > media?
>
> Macromedia Director, Media Cleaner Pro, Ray Dream, Poser, Bryse etc...

I'm not sure you are correct in handing me this list. Quicktime does not recognise the 16-bit anims, although a PC with Autodesk Animator did a while ago, even though it couldn't play the thing because it was limited to 256 colour anims. It at least recognised what the file was...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Sounds like sour grapes here..."Who needs G4 processors and cutting edge
apps thats why I love Amiga..."

Tell me were can I buy a brand new G3/350 Amiga with 64 MB, 6G, 2xAGP/128
Rage, Harmon Karden Speakers, screen and software bundle for $999.  Plus
has a future running OS9, OSX client beyond.  No need to run inferior net
apps on this platform...

JET MOTO 3
THE RUSH IS BACK!

Sideswipe enemy racers, hang a hard left at the vertical grapple, and speed your way to the finish line! Jet Moto 3 takes you full throttle through 19 obstacle-filled, bone-smashing environments, as you attempt to conquer subterranean graveyards, ancient cities, volcanic eruptions and alien worlds. 11 insanely fast, all-terrain jet hover bikes, including new riders such as Angel and Convict, will take you on the ride of your life as you jostle, sideswipe and fight for position against the most challenging racer AI to date. You’ll feel every bump, bruise and crash with the all-new 3D racing engine with MotoPhysics⍰, delivering blazing fast gameplay and crisp, beautifully detailed 3D graphics. Jet Moto 3. THE RUSH IS BACK!

KEY FEATURES:
⍰ Race any of the 11 ultra-realistic, all-terrain jet hover bikes. Old favorites like The Max, Wild Ride and Vampeera team with new riders such as Angel and Convict. Each rider/bike boasts his or her own performance ratings

for acceleration, top speed and handling.
⍰ All-new 3D racing engine with MotoPhysics⍰ delivers blazing fast gameplay and beautiful 3D graphics. Experience outstanding handling and even an occasional horizontal and vertical grapple!
⍰ 19 treacherous, bone-smashing environments to conquer, including an ancient Inca city, a subterranean graveyard, the gut-wrenching SkyPark, as well as the wildest, most thrilling stunt tracks ever designed!
⍰ Feel the effect of eleven different racing surfaces, such as ice, wood, metal, rock, lava, grass and concrete.
⍰ Experience realistic weather effects including snow, rain and night racing.
⍰ Challenging AI jostle and fight for position by crowding or side-swiping other players.
⍰ Rip it up or get wasted in 1 Player modes (Single Race, Season, Circuit and Practice) or 2 Player modes (Single Race or Circuit) with 4 season difficulty levels: Novice, Semi-Pro, Pro and Expert.

JET MOTO COMPARISON

	Jet Moto 2	Jet Moto 3
Sales (thru 8/99)	1,250,671 units	N/A
Players	1-2	1-2
Bikes	10	11
Tracks	10	19
Magnetic Grapple	Yes	Yes
Vertical Grapple	No	Yes
Hop Button	No	Yes
Stunt Mode	No	Yes
Engine	Improved polygonal graphics	All-new 3D racing engine with MotoPhysics

WHY BUY JET MOTO?

Heritage -
The Jet Moto franchise is far and away the best seller in the pure Action Racing category.
⍰ Jet Moto 1 has sold through 1,170,508 units through August, 1999.
⍰ Jet Moto 2 has sold through 1,250,671 units through August, 1999.

If a page is loading that slowly, it's the pipe that's the
bottleneck,not the PC. I can personally attest to the fact
that lowend Pentium class hardware can infact keep up
with a T1 connection. Never mind a serial modem.

You're just full of it.

My Atari 800 doorstop might not be adequate but, certainly
a $100 machine from Computer Renasiance or a $300 machine
from the web will most certainly do.

```

     This is bullshit, spread primarily to make overpriced Mac
     hardware look good. 64M is meagre, the Rage 128 is the
     lowest performer in it's class and 2x AGP for bargain bin
     machines.

     Even a discontinued Pentium, HELL a 486 will happily do OLE
     object imbedding. I did just that on my 486DLC in college.

     A desktop Sparcstation simply isn't required.

No arguement there, it would be foolish to suggest otherwise.

That doesn't change the facts on the market the iMac is aimed at, or the
A4000 patent reference for USB however.

Regards,

Clockmeister.

http://www.digitalproducer.com/aHTM/Articles/10_11_99/avid_systems_dominate_tv.htm

----
From "Digital Producer" magazine:

96% Of Fall '99 Primetime Television Shows Edited On Avid Systems --
101 of 105 Primetime Fall TV Shows Cut on Avid Media Composer/Film Composer Systems; Several Shows Make the Leap to Nonlinear Finishing with Avid Symphony --

TEWKSBURY, MA., Oct. 13--Avid Technology, Inc. announced that 96% of primetime television shows this fall are being edited using the Avid Media Composer and Avid Film Composer systems, and a number of shows have taken the next step in nonlinear television post production by finishing on the company's new high-end Avid Symphony system. 101 of 105 (1) shows in the 1999-2000 fall primetime television lineup -- including David E. Kelly's `98-99 Emmy-winning Best Drama "The Practice" and Best Comedy "Ally McBeal," as well as `98-99 Emmy recipients in the editing category, "The Sopranos" and "Sports Night"-- are being cut on Avid's industry-leading Media Composer or Film Composer systems. Popular returning drama "Profiler" and `98-99 Emmy winner for animation "King of the Hill" are set to online their seasons using the Avid Symphony system.

Uh.. TIFKAS? Just exactly how many network TV shows are shot and edited on DV? Er.. that would be none!

Yep.. Avid is shakin' about this FCP business.. yep..

It's just too easy to make you look uninformed.. not even a challenge.

-Mark

You may be thinking of Datalite 2. I used the program years ago and it
seemed to be reliable and fast enough (on a TT, I don't know what it would

be like on an ST). Unfortunately it didn't work with other not FAT filesystems under MiNT. Since then I no longer have a lack of hard disc space so I have never tried to use it again.

The best thing you could do is simply buy a larger hard disc drive.

I remember that name from a quite a few years ago. It came to a point where he threw a fit and left the newsgroup if I recall. That was around the time Doug Little was still active in C.S.A.

                          Palfrey) was overheard babbling midlessly :

                          >As for your criticisms Jack, admit it, you are
simply a
                          simple
                          >tool user. Don't try to claim "Amigan". You
weren't. You
                          simply
                          >used the machine in a stock config with an
extremely
                          specialised
                          >painting card. You never modified or updated
it.
```

I also originally ignored your rather ignorant post to me about not being an Amigan.

Pray tell who died and made you GOD? way I see it you are a ranting idiot, and a clueless one at that.

You Terry are no Amigan. and that pretty much applies to most of the people here as well. Few if any here are really true Amigans.

I am more Amigan than you will ever be.

Amigans were people who pushed the limits and made great effort to be the biggest and best at everything. Images, music, demos etc. Amigans did not settle for second best. Amigans made their own hacks to expand their a1000's to have more memory, magazines covered articles on how to hack the hardware. They pushed the edge when it came to just about everything.

An Amigan did not SETTLE for second best.

A TRUE Amigan would not settle for the fact that Amiga cannot take advantage of the majority of the simple internet STANDARDS that every other computer on the market can take advantage of like HTML 4.01, Flash, Shockwave, Real Audio and a lot of others.

deluded nut cases like Steve Giovanella can sit around and blab all day about how ImageFX can FINALLY animate now and cost 3 times what Paint Shop Pro does, and babble on about how fast the Amiga boots and yet has little software available for that very expensive PPC card he bought.

I'll clue you in on a few things right off....
You think PPC is
some great triumnph? dream on. PPC is a dead
end and
everyone knows it.

Do you truly believe P5 will have that promised
AmiRage
anytime in the near future? not this year thats
for sure.
probably not next year either.

Why? Apple cannot get G4 chips, what makes you
think P5
can? it is not going to happen. plain and
simple. Of course that
means that the P5 cards they promised with G4
and Neutrino
will not be shipping anytime soon either.

TRUE AMIGANS would not tolerate this crap.

TRUE AMIGANS would not have acted like the
desperate fanatics
that everyone did when the iWin hoax started.
Frankly I though
it was pathetic to see people all excited over
the promise of
decade old technology being repackaged and sold
for premium
prices. The posts that followed iWin were
nothing short of
pathetic.

>And since CSAA is my hangout, I'll take that
comment you
made
>quite seriously as a true indication of your
real feelings.

A typically arrogant bit of nonsense from you,
and not
particularly unexpected. CSAA is not YOUR
domain pal. It is
free to anyone who wants to post here. If you
don't like then get
therapy, because you are getting delusional

here.

Your judgemental attitude and labeling of
people who YOU
consider is Amigan or not is pretty lame. I got
news for you,
you do not decide who is an Amigan or not. It
is just that
simple.

Clutching the straw arn't we....Try this on size...Gee I wonder why...Look to see more fire sales at Avid...

Avid Technology Announces Third Quarter Results and Senior Management Changes

- CEO and President resign; Company to deliver restructuring plan in 30 days -

TEWKSBURY, Mass. (October 20, 1999) - Avid Technology, Inc. (NASDAQ: AVID) today announced financial results for the third quarter ended September 30, 1999 as well as certain senior management changes and its intention to significantly restructure its business.

Third quarter 1999 revenues were $113.3 million compared to $116.2 million in the third quarter 1998. For the third quarter of 1999, the Company recorded a net loss of $13.1 million, or $0.56 per share, which includes amortization of acquisition-related intangible assets. Excluding the acquisition-related amortization, the Company recorded a tax-effected loss of $1.4 million, or $0.06 per diluted share, compared with net income of $8.0 million, or $0.30 per diluted share, in the same quarter a year earlier.

For the nine-month period ended September 30, 1999, revenues were $340.9 million versus $337.8 million in the same period in 1998. For the nine-month period ended September 30, 1999, the Company recorded a net loss of $32.6 million, or $1.36 per share. Excluding acquisition-related amortization and non-recurring costs, net income was $4.0 million, or $0.15 per diluted share, compared to $25.0 million, or $0.99 per diluted share, for the same nine-month period in 1998.

The company also announced the resignations of its Chairman and Chief Executive Officer William J. Miller and President and Chief Operating Officer Clifford A. Jenks. On an interim basis, Chief Financial Officer William L. Flaherty has been named Acting Chief Executive Officer. David Krall, who is currently Chief Operating Officer at Digidesign, Avid's professional audio business, has been appointed Avid's President and Chief Operating Officer and will lead the restructuring effort. The company also announced that the Board of Directors has initiated a search for a permanent Chief Executive Officer, which it hopes to complete within three months.

Mr. Miller said, "I am proud of what we have accomplished at Avid during the past several years, but the fact is that our plans to grow the business have not been successful. As Avid seeks to reshape itself for the future, it is appropriate that new leadership take on that task. I wish them well in that effort and look forward to Avid's future success."

Said Mr. Flaherty, "Avid embodies numerous strengths as a recognized leader in digital content creation tools and media management with exceptional products and valuable proprietary intellectual property and technical expertise. The goal of our restructuring effort will be to channel these strengths into our strongest market opportunities with an infrastructure that supports a realistic and profitable business model as we enter the year 2000."

He added, "Our performance to date in 1999 has obviously been a disappointment. Our market realities have been changing rapidly, making our current business plan increasingly difficult to achieve. The Board believes that a thorough restructuring is necessary to position the company for future growth and profitability."

Mr. Krall noted, "We plan to closely examine all aspects of our business as part of this restructuring effort to align expenses with revenues and continue to invest in areas for future growth. It is critical to ensuring the company's on-going success, and I intend to work closely with our Avid team in developing an effective plan within 30 days. We are committed to achieving the results this company can produce, for the benefit of our customers, employees and shareholders."

Mr. Flaherty joined Avid as Chief Financial Officer in September 1996. He has previously held senior finance positions at Gibson Greetings Inc., FMR Corp., the parent company of the Fidelity Investments Group, and Du Pont. He holds an AB degree from Dartmouth College and an MBA from the Amos Tuck School of Business Administration at Dartmouth.

Mr. Krall brings a strong technical background to his new position, as he holds BS and MS degrees from the Massachusetts Institute of Technology. He has held his current position with Digidesign since May 1998. He joined Avid Technology in May 1995 as Digidesign's Director of Program Management and later served as Digidesign's Vice President of Engineering. He also holds an MBA from the Harvard Business School.

Third Quarter Results Commentary

"During the third quarter, we ran an aggressive promotion of ABVB-based Media Composers as part of our Macintosh initiative," Mr. Flaherty said. "This resulted in increased Mac-based Media Composer sales versus the prior two quarters, but it adversely impacted gross margin and was a principal contributor to the quarter's operating loss."

He added, "Our balance sheet remains strong. We continue to generate cash and ended the quarter with cash and investments of $83.1 million, up slightly from $82.5 million at June 30, 1999."

The above includes forward-looking statements based on current expectations that involve a number of risks and uncertainties. Actual results may differ materially from those described therein, depending on such factors as are described under "Certain Factors That May Affect Future Results" in the Company's Annual Report on Form 10-K for 1998 and Quarterly Report Form 10-Q for June 30, 1999, filed with the SEC.

"The iMac has been the biggest computer launch we've seen in our history. Apple is back, and iMacs are flying off CompUSA store shelves across the United States."
James Halpin, president and chief executive officer of CompUSA

nope, he used DejaNews, known far and wide as an excellent search engine for finding old Internet posts, but its posting facilities are substandard especially regarding cut and paste. It's known by many Internet experts as basically training wheels for the Net clueless before they graduate to REAL newsreaders (which on the Mac includes the excellent MT Newsreader).

Of course, seeing as TiFKAS doesn't have two rocks to rub together for brains, he's perfectly incapable of setting up a real newsreader for plopping down his steaming piles of drivel. His inability to spell is well proof of that.

Besides, he'd hurt himself on an Etch-A-Sketch(tm) :)

Guess TiFKAS succumbed to another brain fart, now that the Steve Jobs Reality-Distortion Field(tm) is crumbling around him what with the events of the past month (Apple cancelling G4 orders, trying to get the Apple fans to re-order for $1000 above the original selling price, then reversing themselves once they realized they were setting themselves up for another lawsuit, introducing a 350mHz G4 (which is BELOW the original G4 specs, looks like a lot of chip failure on the assembly line!), the discovery that the not-ready-for-prime-time Final Cut Pro WON'T RUN on the new DV iMac (which Apple has admitted, but won't allow discussion of on their web site), Avid is REALLY QUAKING IN THEIR BOOTS about this, Apple caught crippling G3 computers so they won't take third-party G4 upgrades...

all of this was found on comp.sys.mac.advocacy, the place TiFKAS is too chicken to post willingly to, due to the fact that not only that he hates scrubbing off scorch burns, but the fact that the knowledgable Mac fans will quickly unmask him as a poseur pretending to be an "Apple Power Rep"...

gee, what with all this, Apple's Board Of Directors may soon be Thinking Different, decide that they're paying uberboss Jobs a dollar too much, and wind up throwing his head to the stockholders...

OH MY.. even for YOU this is incredibly stupid.

Do you THINK for a moment that the MAJOR studios shop for their NLEs
(non-linear editors) by what's on SALE!?!? What a moron.

Yea, they're going to base their decisions on whether they can save a few grand..

:)

Man you are dense.. another brilliant retort that further shows how ill-informed you are.

It's better to keep your mouth closed and be thought an idiot then to open your mouth and remove ALL doubt.

What happened is that they could not get 500mhz G4 chips from Motorola.
Were down to two models from here. The 350 G4 is in plentiful supply.
All they did was reduce the clock speed by 50 mhz for the same
configurations. They did reverse and those who ordered prior to Oct. 13
will get their machines as promised. Could they have handled it better?
Yes.. To bad Atari did not honor their contracts with their dealers and
developers while stealing the 'handy' from Epyx...

FCP runs fine thank you..

A certain 68k Jihad claimed it was too late for Apple to release new
Milan crunching G3 iMacs for the Christmas quarter. Once again the chunky

soup turns cold while Apple's worldwide manufacturing will churn out tens
of thousands per week of these awesome sucessor to the popular iMac..

     That won't help. Your etchasketch cut and paste even
     looks lousy in 132 columns.

why do you keep bringing up your imaginary friend "Chunks" into it? Or are you getting completely delusional?

The Simpsons have said many more things of intelligence and wit than our sorry friend TiFKAS. Or is it that TiFKAS is jealous of the fact that Matt Groening will be remembered as a legend, while he will be completely forgotten?

ah, showing again your extreme ignorance, eh, TiFKAS? I'm working in eighty columns here.

and it's obvious that you don't review your work after putting up your brain-dead posts, for you would see that your cut-and-paste work was smeared all over the screen, thereby ruining the effect you were attempting.

TiFKAS is still stuck in 1989 - just like the basis of the MacOS....

gilding the lily, eh, TiFKAS. Apple said themselves that anything below 350mHZ would not be suitable for their G4 machines, and Motorola was going to use them for imbedded devices for other manufacturers. When the 500mHZ turned out to be defective, and it appeared that there wouldn't be any G4s unless something was done, Apple must've had to swallow hard to release a new machine that was below the lofty standards they set.

They did reverse and those who ordered prior to Oct. 13
> will get their machines as promised. Could they have handled it better?
> Yes..

to begin with, they should've made sure the machines worked before announcing them. Jobs has egg on his face as he should.

To bad Atari did not honor their contracts with their dealers and
> developers while stealing the 'handy' from Epyx...

again, TiFKAS gets it wrong. Atari did not "steal" the Handy, they bought the rights to it from Epyx when it was obvious they couldn't afford to market it on their own...

>
> FCP runs fine thank you..

no it doesn't....

from www.macintouch.com (an Apple news web site who won't kiss Jobs' ass)

Dennis Csillag reports Final Cut Pro incompatibility with the new iMac DV (and Apple's lack of interest in discussing it):

"I was interested in using FCP with the new iMac DV's, so I went to Apple's Final Cut Pro Forum. There were already a few questions there about the issue. Apple's response was that FCP is not certified for iMacs. When I pointed out that the DV iMacs fit the system requirements (Processor, Monitor resolution and Firewire i/o), my post was deleted and I got the message that 'questioning Apple's decisions or future releases) is not appropriate for this forum.'

what colour is the sky in your world, TiFKAS?

>
> > all of this was found on comp.sys.mac.advocacy, the place TiFKAS is too

hmm, there's no proof there that you're an Apple Power Rep, POSEUR. Or did you come up with that web site while using the free web service at your local library?

again, name of business. name of supervisor. number where he can be reached during the day. Not doing so only proves what a coward you are.

>
> > gee, what with all this, Apple's Board Of Directors may soon be

>
> Your kidding right?

were you kidding when you said that if Jobs got back in he would completey destroy Apple, and that he was an arrogant bonehead? well guess what, you were right there - announcing new computers before they were even tested to make sure they worked is the mark of a true bonehead. Announcing new computers before they could ensure a plentiful supply is the mark of a bonehead. Trying to cancel orders of computers the company couldn't supply, then trying to make the suck^^^^^customers to re-order the same computers at $1000 more and not expecting a firestorm is the supreme act of arrogance, and the supreme definition of bonehead.

of course, since TiFKAS fits the description of a blindered BOZO (Bitter Obstinate Zealot Order), he continues to apply tongue to boot leather, indeed he seems to have acquired a taste for shoe polish...

First of all apologies if you have read this message in another newsgroup.

16/32 Systems are setting up a new domain with full retail catalogue. At the moment we have a basic catalog set up and will be expanding on this every day, we plan to publish articles, help files in a general area as well. I would like to make this a first or even second stop for Atari Users. The catalog at moment is fully useable and if you wish to order then please do so. Whilst we are knocking this area in to shape we will confirm each price before sending.

However I require input, please browse pages as they come if you wish and let me know what you would like to see either available or as general interest. If you wish to contribute or have any other queries please email below. If you wish just to be kept informed then email me and I will add you to the list.

The reasons for this are basically due to personal (sickness) matters I am closing my shop and concentrating on Mail Order plus Internet stuff plus my contract work. So I am going to have a lot more available time and I might as well use it.

The URL at the moment is http://catalog.zen.co.uk/actinic/16_32_SystemsX/

You can now email me on nick@1632systems.co.uk or
nahrlow@cix.compulink.co.uk

Thanks for your time

Nick Harlow

Thanks. I'll look into it. It sounds a lot like HP's line of
DOS-compatable palmtops (LX-95, LX-200, IIRC)...I was hoping for
something completely novel and not intel-based.

Well the humble Portfolio is certainly not Intel based. They use an
operating similar to DOS, but different:)

They come with address book, editor, w sheet, Diary and calculator built
in and can be connected to the external world using extra hardware;
serial port, parallel port add on's etc.

the article in the local paper referred to 'sales people' and
_specifically_ mentioned that 'Apple trained' people would NOT be
effected. That item was the reason for my original post.

No we cannot and that is why we're happy to remain Atari users. We don't have to put up with overbloated bullshit softwares that perform the same number of useful tasks for your average user as a copy of CAB or AWEB for Amiga does, yet uses 10 times the system resources...

You think we're silly? We think YOU are...

Kind regards,

Where did I say that Gates had anything to do with the demise of the new
Amiga?.
If you're suggesting that Gates/MS doesn't enforce certain licensing
conditions upon PC manufacturers/sellers, you are the one who is stoned. In
that regard Gates does control Gateway to a certain extent.

How much does the maker of the Milan want for yesteryear's 040 /060
boxes?    Maybe by 2010, a Milan PPC from the 10th owner will be reality.
By that time you should beable to get a dust infested iMac/333 for $79...

well well well. Seems TiFKAS didn't realize one of his missives wound up on comp.sys.mac.advocacy - and he got a reply from a well-known Mac defender, Joe Ragosta, that proves that we can now add the how businesses work to the other things the little pretend "Apple Power Rep" doesn't know beans about.....

> prices?

Actually, that's not quite true. Changing from a commission to salary structure doesn't necessarily increase prices--or reduce service.

Let's say your average Fry's employee makes $15,000 in salary and $10,000 in commission (making the numbers up, but the actual numbers are irrelevant). If Fry's switched to straight salary and paid $25,000 per employee, their total expenses would be unchanged.

In theory, by basing the compensation package on commission, you get better sales people. In my experience, what you get are pushy people who sell crap to unsuspecting innocent people in order to make a buck.

Personally, I prefer to pay most compensation in salary with only a small commission piece. There is the risk that you'll keep the lousy sales people and lose the good ones, but I haven't found that to be the case. Pay a fair salary and you'll be OK. And fire the lousy sales people.

Of course, Fry's may want pushy sales people who mislead customers to make a buck........

--
Regards,

Joe Ragosta

you gave me evidence that didn't have any proof that they were talking about you. And yes, you still are clueless.

Once again, provide tangible evidence, coward. Name of business. Name of supervisor. Number where he can be reached during the daytime. Should only take a few minutes to confirm....

But of course, we already know that you're a phony baloney who has proven time and time again that you have absolutely no knowledge of how the computer business operates, no less how retail works or even the standards of what the video industry works....

Organization: Mac User. Atari Enthusiast.
NNTP-Posting-Date: Wed, 29 Sep 1999 17:22:59 EDT
Newsgroups: comp.sys.atari.advocacy

another crosspost from comp.sys.mac.advocacy:

looks like InCompUSA, already reeling from the layoff of half its workforce, is now attempting new ways to market - and as always, shooting themselves in the foot.

The result? Apple loses its major supplier in the US.

Bet TiFKAS won't be bragging about this....

Ok, I've bought a few things at CompUSA online in the past, but no more. First, they no longer accept the CompUSA credit card which offers 6 mo. same as cash for purchases over $300 (a major incentive to buy in the past), and second, they refuse to even attempt to match other mail-order prices.

What's the point?

But here's the kicker: Today, I get a special rebate offer from them for $50 off any online software purchase of $150 or more. You *download* software via Digital River, you obtain the online receipt, then you're supposed to *print* both the receipt and this winky coupon, stick it in an envelope and snail mail it to CompUSA and wait 10 weeks for a check!

Yes, I understand the psychology of rebates, wherein a percentage of schmucks never get around to sending it in, thus giving companies free money, and even those who *do* get around to submitting it wind up giving companies a zero-interest loan for 2-3 months. Frankly, between the grocery store club cards (aka "let's track every purchase you'll ever make" cards) and rebate hell, I'm not sure which is worse...

But how LUDICRIOUS is it to enact a 100% digital transaction, only to have to print and snail mail your rebate coupon? ... at least with a *physical* purchase (where some kind of packaging is involved) the rebate requires labels or POP's to be sent in. But in this case there is absolutely no need for this stuff. The only reason the user is required to snail mail the material is because it increases the likelihood that the user might delay or forget to do so.

This is so overtly tacky, I had to bring it up here in csma.

Getting up to 33% off isn't necessarily a bad thing, mind you, and some folks might happily take advantage of the offer. Personally, I'm fed up with the proliferation of rebates and this is the last straw.

Kinda like when I first heard Peaches and Herb sing "Shake Your Groove Thing" in the 70's and realize that Disco had sunk to its lowest ebb. A friend of mine and I bought one of the first "Disco Sucks" shirts in protest (that's right, it was a custom iron-on! and we were at the vanguard of the burgeoning T-shirt-wearing masses who brought Disco to its knees! <g>)

Hmm ... "Rebates Suck." Now *that's* a T-shirt I would happily receive and wear at a trade show.

Atari apps are frequently updated and can perform many of the tasks
that you Mac and PC owners seem to think are your domain only. The
difference is that modern apps on Atari don't need stupid amounts
of system resources or high-speed machines to function. To all
intents and purposes for an -average- PC or Mac user, a fast
CPU is not nearly as well noticed when they go to use their
word-processor or spreadsheet or web-browser...

> Sounds like sour grapes...

Not sour grapes at all. Did I say I was jealous of the fact that
Netscape, W98, and IE don't work on Atari? No I didn't! Learn to
read pal!!

> By the way...Navigator and IE run just fine on my PB G3/266...

'just fine'? Why not brilliantly like APEX media or any D2D
recording software does on my Falcon? That sums Mac and PC
down to a tee...kings of the mediocre...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> In the movie Terminator 2, the John Connor (kid) character uses a small portable computer (looked similar to modern WinCE devices, in terms of formfactor) hooked up to a credit-card-like device to hack PIN numbers for ATMs/etc to get easy money. There is a brief flash where you can see the Atari symbol on the computer above its small QWERTY keyboard.

Its the real deal and its name is ATARI Portfolio. Its a 8086 based DOS portable that has software in ROM and more besides...

Also look in other movies for Atari showings...a good one would have to be 'Blade Runner: Directors Cut'. The scene where Deckard chases a replicant through a busy city street shows an Atari shop...

ATARI...only in the best movies! (unlike PC or Mac whose showings seem to be limited to b-grade crap movies, and then only with a GUI that is completely removed from original!)

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

You rrrraaannnnggggg?

Yes, it's pretty much all over as far as the prospects of a new Machine is concerned. Gateway have seen to that.
The new Amiga will basically consist of a software layer that sits on

```
another OS, any OS. It is supposed to provide some interface for controlling
various things over a network/internet or something.
In my opinion it ain't worth a shit... everyone else is doing that already.

Not a dignified end, but I guess Amiga the computer is now in the same
position as Atari... no parent company (to speak of).
Phase V and others are developing clones along with the QNX OS as an option.
That could be interesting.

Amiga ain't dead just yet ;-)

Regards,

Clockmeister.

Hi Darkchyld,

No Amiga, Jim Collas is gone (Amiga's best president for a long time IMO) due to a disagreement with Gateway over the future plans for Amiga. Jim didn't like the fact that Amiga was to be (effectively) scrapped, and he left/got pushed cashing in his shares in the process.

Anyway, Jim Collas still reads c.s.a.m but is keeping his head low (probably for legal reasons) showing that he did at least have some interest in the community and their hopes for the next gen Amiga.

None of that matters anymore now though. Gateway/Amiga Inc. are no longer developing a new machine or OS, just some software thing that will run on various OS's. Look for it in the bargain bins at your local PC software retailer.

Regards,

Clockmeister.

Apple just posted a Special event announcement for Tuesday Oct. 5.

http://www.apple.com/quicktime/showcase/live/appleevent99/

Draw your own conclusions. Remember Apple has three huge iMac production
facilities worldwide. Yes it would be tough for the then Atari to
announce a new model today for Christmas time frame due to their lone
garage size manaufacturing facility.

>
> well, looks like I'll soon be able to buy a Mac 7200 for $79 :)

Congrats for finaly reaching PPC before the century is out. Five years
better late than never..

Much of the Fry's are in California. You will not get much for $25,000 a
year which is considered below profesional mininum wage.. I knew folks at
Fry's on the sales floor who earned $50,000 K plus a year and they worked
their tale off to service the customer. There are bad apple's at Fry's
and elsewere but there are stars.. Retail is retail...buyer beware. A
polished customer will do their homework before entering..Customers
demand that the staff are experts on every product that the store offers
and that is unrealistic. Had one PC customer approach me in Apple land
at CUSA during my work call and asked me questions about this obscure PC
app. I had no clue and never used the product. He got all indigent and
demanded that I find a sales person that used this product. I told him
it was like finding a needle in a haystack to find a staffer that used
the product... plus that I don't work for CUSA and motioned him to look
up at the ceiling banners and carpet in Apple Land.

> In theory, by basing the compensation package on commission, you get

```
> better sales people. In my experience, what you get are pushy people who
> sell crap to unsuspecting innocent people in order to make a buck.

By paying low wages by the hour you get indifferent sales people.  The
compensation methods are not perfect...The commission approach at Fry's
is the proper method..

> Personally, I prefer to pay most compensation in salary with only a small
> commission piece. There is the risk that you'll keep the lousy sales
> people and lose the good ones, but I haven't found that to be the case.
> Pay a fair salary and you'll be OK. And fire the lousy sales people.

Not on $25,000 a year...Even the burger flippers at the fastfoods can
make that in Calif...

> Of course, Fry's may want pushy sales people who mislead customers to make
> a buck........

Rule of thumb...Always come prepare and do your homework before walking
in a store..

>
> Bet TiFKAS won't be bragging about this....

First of...CUSA laid off half their commercial staff of 3,600. About
half of the laid off accepted positions in their new corporate calling
system in Dallas according the press release. CUSA currently employs
20,000 according to the press release.. Hardly half off...

Second of...What does this have to do with Apple losing it's supplier?

> Ok, I've bought a few things at CompUSA online in the past, but no more.

Indeed, that is the project which, if successfull, will put the destiny of the Amiga computer in the hands of the users.

Offcourse, the new Phase V G4 Amiga clone looks promising as well, with the QNX RTOS as an option it looks like an interesting combination.

Good to see the Atari clones continuing to sell steadily.

Regards,

Clockmeister.

OK Einstein...does your G3 Mac make you type numbers or letters any
quicker than a 8086 PC or 68000 mac would? The answer is (ding!) NO!
Your average dickhead isn't into graphic/video/highband audio etc apps
they just want to type emails and letters!!

Upsetting the Apple cart

Andrew Coyne
National Post

Ihave recently purchased an iMac, the see-through, fruit-flavoured, moulded-plastic phenomenon that, quite simply, saved Apple Computers. It's a nifty little device. It is also, inevitably, a metaphor. Be warned: Further on, I will use it as a model for how Canada might effect a similarly dramatic turnaround.

But first, a dash of reality. The tax-cut chorus is now approaching critical mass: Business, labour, social groups, all five political parties, the premiers -- all favour some sort of tax cut, if for different people, and for different reasons. The most insistent calls, however, come from those alarmed at the large and growing gap in income tax rates between Canada and the United States, and the consequences that are said to ensue: a productivity gap, an income gap, and an exodus of talent and capital in pursuit of the lower taxes and higher incomes to be had south of the border.

Whether any of these horrific events are actually occurring is a matter of some debate. It is not yet clear, for example, whether the brain drain is any worse now than it has been historically. My own view, for what it's worth, is that we are seeing the first signs of a problem that, if it is not yet evident, will get much worse in coming decades.

That's the good news. The bad news is that there is little we can do to avert this fate -- at least, not with the remedies currently on offer. The forces at work drawing labour and capital into the industrial centres of the United States are as ineluctable as gravity, and much too powerful to be offset by a few piddling tax cuts.

The most obvious aspect of this, of course, is that pre-tax incomes are so much higher in the States, at least for those in the educated, knowledge-economy elite: the very people, as it happens, most inclined to move, and with the fewest natural obstacles. So even if we slashed taxes to U.S. levels, or lower, we still wouldn't have closed the gap.

Mind you, it's probably true, as tax-cut advocates contend, that the gap in pre-tax incomes is itself due in part to the differences in tax rates. If Canada's higher tax rates lead investors to make proportionately fewer investments or workers to supply less labour, that would help to explain our relatively poor productivity and consequent lower incomes.

Alas, that isn't the only reason. This is where the Apple analogy comes in. Canada today is facing very much the same threat as Apple in the early 1990s: a "positive feedback" loop in which an early market lead, rather than being reversible through price cuts or other conventional strategies, becomes itself a source of competitive advantage.

In Apple's case, the company had, for reasons unrelated to the quality of its product, seen its share of the personal computer market dwindle. That meant fewer software titles were published in Macintosh format, which made consumers even less likely to consider buying a Mac.

The company was caught in a death spiral, much like the one that killed the Betamax video format in the 1980s. Incremental changes would not be enough: What was needed was a product so radical, so irresistible, as to generate the sort of sudden, quantum leap in sales that alone could reverse the spiral. A product like the iMac.

The positive feedback loop that is pushing U.S. productivity further and further ahead of other countries' is very similar -- and doubly lethal to Canada. Not only are American firms profiting from the "lock-in" effect of early leads in any number of knowledge industries. It also seems that they gain advantage from sheer physical proximity to one another: The firms in Silicon Valley have a richly stocked talent pool to draw from, who can change jobs by crossing the street.

So a second feedback loop emerges, again to the United States' advantage. Firms and people go there, in part because other firms and people go there. This is not new, but with the rise of the knowledge economy, it is more pronounced. And it is potentially devastating to Canada.

Like Apple, we can no longer rely on incremental strategies, i.e., tax cuts. To turn things around, we need the policy equivalent of an iMac: something so startling, so extraordinary, as to compel footloose capital and labour to once again give Canada a look. Do I have one? Yes I do. Abolish the income tax.

Don't get too excited: The same revenues would still have to be collected somehow. To replace the $100-billion or so the federal government raises every year in personal and corporate income tax would mean increasing the GST to about 35%. But think of it! No tax return to fill out. No tracking of expenses, no calculation of capital gains or accounting for depreciation. And no tax at all on income you don't spend.

I realize this is an idea that requires more than one or two paragraphs to develop. The point here is only that we need to expand the tax-cut debate, if we are to counter the pull of American economic gravity. We need to think big. Or to borrow a slogan, Think Different.

The mac spin: http://www.applelinks.com/mooresviews/coyne.shtml

iMac-Using Pundit Cites Apple's Turnaround Strategy As A Blueprint For Addressing Canada's Economic Distempers

By Applelinks Contributing Editor Charles W. Moore

Respected Canadian political and economic affairs columnist Andrew Coyne has recently joined the ranks of iMac users, and this week used Apple's iMac-driven turnaround in his latest National Post column as a metaphor for how Canada might also reverse its current national economic distempers -- especially those related to Canada's punishing tax rates.

Mr. Coyne notes the large and growing gap in income tax rates between Canada and the United States, and its widely-alleged consequences including a productivity gap, an income gap, and the famous "brain-drain" that sees a significant proportion of Canada's best and brightest exit south each year in pursuit of the lower taxes and higher incomes.

Mr. Coyne thinks, and as a fellow commentator on Canadian public affairs I heartily agree with him, that these problems are going to escalate if they are not effectively addressed by drastic reforms.

Half-measures will not do. As Coyne puts it, "The forces at work drawing labour and capital into the industrial centers of the United States are as ineluctable as gravity, and much too powerful to be offset by a few piddling tax cuts."

And this is where Coyne's iMac analogy kicks in. "Canada today is facing very much the same threat as Apple in the early 1990s," he writes, noting that in those dark days of 1996-'97, Apple had seen its market share erode, resulting in less software being published in Mac format, which made consumers even less likely to consider buying Macs, which made it even less attractive for developers to write Mac software.

"The company was caught in a death spiral," says Coyne. "Incremental changes would not be enough: What was needed was a product so radical, so irresistible, as to generate the sort of sudden, quantum leap in sales that alone could reverse the spiral."

That product was of course the iMac, which as Apple-watchers know, catalyzed one of the most dramatic turnarounds in corporate history.

Coyne asserts that Canada is currently in a situation not dissimilar to Apple's in the mid-'90s. "Not only are American firms profiting from the 'lock-in' effect of early leads in any number of knowledge industries," he notes, but it appears that they benefit substantially from sheer physical proximity to one another.

Consequently, as with the chicken-or-egg matter of Apple market-share and third-party software development, high-technology companies and personnel tend to locate in places like Silicon Valley, in part because other high-tech firms and people locate there. This dynamic with regard to software development was potentially (and near-actually) devastating to Apple, and it is likewise potentially devastating industrially and economically to Canada. For instance, only 15 per cent of Canadian manufacturing is currently based in technology, compared with 35 per cent of the U.S. economy.

Andrew Coyne maintains that it's too late for incremental strategies such as modest tax cuts to help Canada's technology investment deficit and general economic competitiveness. Because U.S. pre-tax incomes are already so much higher than in Canada that even if Canada slashed taxes to U.S. levels, it would still fall far short of closing the gap. "To turn things around," he says, "we need the policy equivalent of an iMac: something so startling, so extraordinary, as to compel footloose capital and labour to once again give Canada a look."

So what is Coyne's iMac-esque prescription for fixing Canada's economic death spiral?. Abolish the income tax. Well, he said it would be startling! But would it work?

Coyne suggests that in order to replace the Can$100 billion or so that Canada's federal government raises annually through the personal and corporate income tax system, it would be necessary to increase the federal Goods and Services value added tax (GST) from its present 7 percent to roughly 35 percent, which probably sounds awful to most people, but the payoff would be that no one would have to fill out tax returns, record expenses, calculate capital gains or depreciation allowances. The national increase in efficiency in a lighter red-tape and paperwork burden alone would almost certainly boost the GNP a few points. There would be no income taxes deducted from paychecks -- personal income would be yours tax-free until you spent it. And you would not be taxed at all on money saved.

Proving himself a master of understatement, Mr. Coyne acknowledges that "this is an idea that requires more than one or two paragraphs to develop."

True enough, and there are also a number of other significant issues besides high taxes kneecapping Canada's economic competitiveness -- for example the fact that 33.1% of Canadian workers belong to labor unions, while less than 15% of U.S. wage earners are unionized. The rate of unionization in the Canadian public sector is 71%, with 18% of Canada's private sector workers unionized, compared with only 11.8% of the U.S. private sector labour force .

Canada also has one of highest strike rates in the industrialized world, averaging 407 strikes per year between 1990 and 1996, compared with just 38 in the United States, 191 in Japan and 306 in the United Kingdom - - all countries with much larger populations. Small wonder that Canada struggles to keep its head above the increasingly rough waters of international competition.

Successive Canadian governments have irresponsibly attempted to wallpaper over the productivity gap through that time-honored method of propping up failing economies -- currency devaluation -- which is why the Canadian buck, which traded at more than par with the greenback in 1976, is now worth about 68 cents, up a bit from its all-time nadir of 63 cents in the summer of 1998.

Still, I like Andrew Coyne's income tax abolition idea. Unlike many GST- hating Canadians, I have long believed that value added taxes are a much superior vehicle for raising necessary government revenues than the income tax so beloved of leftists, whose ideological orientation is to punish "the rich" and "big multinational corporations" with confiscatory income taxation. As for the argument that a flat value-added tax is not progressive and therefore discriminates against the poorer members of society, there are already graduated GST rebates in place that could be adjusted and enhanced to compensate for the burden a 35% value-added tax would place on lower-income people.

In any event, the present system is not working, folks. Canada has had the lowest productivity growth of any G7 country for the past 25 years, and continues to slip farther and farther behind her G7 partners in standard of living. Canadian real per capita income is about 25 percent less than in the U.S. A Canadian Imperial Bank of Commerce study recently found that Canadians are earning $900 Cdn. a year less per capita in real terms than a decade ago, while American disposable income has risen by $2,200 US per person over the same period.

Since 1996, annual U.S. pay increases averaged 2.0 per cent after inflation, compared with 0.2 per cent in Canada. Had Canada kept pace with U.S. productivity growth since 1979, Canadian per capita real income today would be more than $7,000 per year higher.

Canada's labor cost per unit produced rose 99 percent between 1978 and 1991, versus just 62 percent in the U.S. (the Canada/U.S. dollar exchange rate was the same at the start and end of that period, so currency fluctuations weren�t a factor in these data). That amounts to a 37 percent widening of an already significant productivity gap over one decade. Canada can no longer afford such inefficiency. Actually, we never could, as our 68 cent dollar indicates.

The Organization for Economic Cooperation and Development has warned that Canada's standard of living will fall sharply during the next 20 years unless we clean up our act. "We must work to sensitize Canadians that [productivity] is an issue that really matters and our standard of living, and that of our children, is very much at stake," commented Canadian National Corporation CEO Paul Tellier recently.

In a recent special issue focusing on Canada, The Economist magazine pointed out that Canadians should not resist a "growing recognition" that demands for lowering taxes, cutting national debt, and narrowing the productivity gap with the U.S. are reasonable. The Economist cautions that Canadians will have to become more like Americans to survive in an increasingly competitive world economy.

Even a Canadian government policy paper on productivity by the federal Department of Industry acknowledges Canada's pathetic productivity performance, and paints a grim scenario of a country in danger of becoming a low-wage appendage to the U.S. -- "hinterland status" -- unless we can clean up our productivity performance.

Given these sober evaluations, Andrew Coyne's "iMac fix" for Canada's economic ills is neither extreme nor outlandish. As he summarizes: "The point here is only that we need to expand the tax-cut debate, if we are to counter the pull of American economic gravity. We need to think big. Or to borrow a slogan, Think Different."

Just sinclap...

Jean Cretin doesn't care - he is encouraging the 'whiners' to leave !

Snipped for the sake of brevity

One has only to look at the UK after the 'Thatcher Revolution' which the following governments, even New Labour have not changed - unemployem is at less than 1% and things seem to be economically good - but then we can't compare Canada to a 'real country' can we ???

A 'Country' that cannot, and does not, respect its own borders is not a real country - it is an aggregation of land which will eventually become a real country once populated by people who do really care about it !!!

I find that really sad !

The Canadian Curmudgeon (in snowy Calgary)

There is a movie called "Office Space" out on video in the U.S right now, in one scene a man is waiting for a really large file to save so he can shut down his computer.

It is a Mac GUI and I even think the Apple menu is visible, but when he shuts it down it goes to a c:\ prompt!

> Much of the Fry's are in California. You will not get much for $25,000 a
> year which is considered below profesional mininum wage..

cite, please. And it's spelled "professional", which you are not.

I knew folks at
> Fry's on the sales floor who earned $50,000 K plus a year and they worked
> their tale off to service the customer. There are bad apple's at Fry's
> and elsewere but there are stars.. Retail is retail...buyer beware. A
> polished customer will do their homework before entering..Customers
> demand that the staff are experts on every product that the store offers
> and that is unrealistic.

what is unrealistic here is TiFKAS' claims that he is an Apple Power Rep. His major mispellings alone in the above paragraph are enough proof of that.

One thing about my business that we often get complimented on is the amount of knowledge and understanding of the product we can pass on to the consumer, due to training, trade shows and simply studying the labels of the products before the consumer asks the hard questions. Why should we expect less of the salespeople who sell us computers or software?

Had one PC customer approach me in Apple land
> at CUSA during my work call and asked me questions about this obscure PC
> app. I had no clue and never used the product. He got all indigent and
> demanded that I find a sales person that used this product. I told him
> it was like finding a needle in a haystack to find a staffer that used
> the product... plus that I don't work for CUSA and motioned him to look
> up at the ceiling banners and carpet in Apple Land.

more spelling mistakes. It's spelled "indignant". And who are you to make assumptions about what the staff at that particular store did and didn't know?

The only true part of the above was "I didn't have a clue", which you NEVER had, chucklehead....

nope, TiFKAS is too dense to understand that fine paper, he instead turns to his favorite misinformation rag the National Pest (a.k.a. the Daily Tubby), run by well-known right-wing loony and Augusto Pinochet apologist Conrad "Tubby" Black, who is much the same bully and crybaby as ol' TiFKAS himself. The same paper that ran the article TiFKAS crowed that the "iMac was all sold out up North!", only to be proven dead wrong after my poll of different stores in Toronto last March which showed just how little their reporters did their homework.

A note, TiFKAS - you may want to know that "Tubby" encourages his reporters to have the same neanderthal views that he espouses. Which is why the Daily Tubby is considered a laughing-stock. Indeed, a recent ad that the Tubby has been running here on billboards in Ontario, showing a dog peeing on a Tubby newsbox, ironically reflects how Canadians feel about this idiot and his world-view...

> populating Ontario' !!!!

no, it's just that we're too smart to fall for the empty rhetoric of Preston Manning, he of the rapidly shrinking credibility especially after his immigrant-baiting rhetoric here in T.O. and last night's historic Tory meeting where 95% of their membership rejected Manning's UA scheme. No, Preston, we're not "out of touch" here in Ontario. Just because Mike Harris got another 5 years in power here doesn't mean we're THAT stupid....after all, we, by turfing many of Harris' ministers (many of the same idiots who started many of the problems we still have here like labour relations), and re-electing Harris' biggest critic, Gerard Kennedy, by a landslide (which I as one of Kennedy's constituents helped to do :)) has shown Harris it's not going to be "business as usual" in selling out Ontario to big business.

Still, there's one thing we can agree on - it's hilarious that TiFKAS feels so threatened by his biggest critic that he has to attack an entire country - forgetting, of course, what happened the last time the US underestimated Canada in an attack (does the image of a charred and destroyed White House in 1814 give you any clues, pinhead?)

Note too that he's not bragging about Jesse "The Baby" Ventura anymore - probably even he's realized that Ventura has made Missouri voters the laughing stock of the US after unashamedly whoring himself out to the WWF again...

The handheld is called the Portfolio. Adn yes, they are still around and available. I don't know if anyone is selling them new, but perhaps Best Electronics has some in stock.

Us Atari and Amiga users are the fortunate few that are enlightened enough
to know that Atari and Amiga where the platforms to kickstart the audio and
video revolution in media.

Others will continue to believe the Wintel version of history...
unfortunately.

Regards,

Clockmeister.

So do I! <cue hypnotic trippy coloured light thingy!!>

I seem to remember that many video pre/post prod houses had a Video Toaster setup doing the eye candy and a bank of ST's soothing the ears...not so long ago either...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Not all is roses in the UK. Plenty of poverty centers in the metropolitan areas. Plus Thatcher wanted to implement a renters tax that may have led to her downfall...55% of the folks think the Conservative Party and leader are incompetent..

> A 'Country' that cannot, and does not, respect its own borders is not

There was also another paper that had a similar article. It depends on
your diffinition of sold out.. iMacs in Apple's warehouse and
distribution channel were flushed out. Stores did have very low stocks
at the time...And Apple did sell a half-million during the quarter...

>   A note, TiFKAS - you may want to know that "Tubby" encourages his

I did not attack Hollywood's backlot up north. Just forwarding a
columinists take on the sorry state of the Hollywood's back lot economic
situation..

> Note too that he's not bragging about Jesse "The Baby" Ventura anymore
> - probably even he's realized that Ventura has made Missouri voters the
> laughing stock of the US after unashamedly whoring himself out to the WWF

He is guv of the state of Minnesota located down south...Which is in much
better financial condition than the Hollywood back lot up north. Did you
know that the state had instituted this year due to the huge budget
surplus a sales tax and renter's property tax refund? I missed out since
I moved last Nov. Were for the '97' filers....I should get back $600
for'98' and $1000+ for '99'..

"The iMac has been the biggest computer launch we've seen in

Here in MN...Burger flippers and the folks at Starbucks can start out at
$8 HR plus overtime...Do the math... Imagine what the wage rate is like
in Calif..

I am not a proffessional? How do you know...? Do you know me? Are you
a professional?

True. Try being product professional on 10,000 products..

Studying the labels is not going to tell the customers beans on how it
operates. The customer in question though all the sales person had this
obscure app on their harrdrives at home and knew it inside/out.. Yea

right..

>
> more spelling mistakes. It's spelled "indignant". And who are you to

Yep...Allows me to incorporate text, grapphics and excel work into
PowerPoint vice versa.  Can't do that on the 8086 and 68000.  MS does
need to improve PowerPoint to make it run better.  Maybe Corel will
release their Mac Office 2000 to give MS competition.  IS there something
equivelant on the TOS side?

I think you've missed my point. Sure you can import data, graphics, text etc...into PowerPoint (after all it is a presentations program), but does owning a G3 enable you to create all that >TYPED< original data faster?

My point is that many users just want to type emails and letters...owning a brand new fast Mac, PC, or Milan060, will not help them create these kind of documents dramatically faster than say a 68030 Mac or 486 PC...

The answer almost surely is NO! Unless of course you've gotten real good at typing...

I aim to have a Milan with 060 sharing a big SCSI disk (bus arbitration) with my Falcon. I can use POV-ray on the Milan to render 3D animations and then use APEX media on the Falcon to create hi-colour animations that can be played to VHS video via the Falcons standard composite video out...a nice budget video titling setup...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Hi!

> If anyone has installed Linux on a Falcon030 I could use your guidance.

I was installed Linux on my F030 few days ago ...
In DEBIAN distibution (2 CD's) it's very easy to install Linux, but you
need math coprocesor and 14 MB of RAM.

> I am looking for HowTos and FAQ's/Walkthroughs on installing and make a
> stable build of Linux on a Falcon030

It's included on 1ST CD of distribution.

that's spelled "a dime a dozen". Which is a legitimate criticism.

of course, TiFKAS' "opinions" aren't even worth two cents...

> > Which planet did this guy get off from?
> >
> > I think he should see a shrink...and mend his ruptured mind...poor deluded
> > soul...
>
> Or he could be yanking your penis for all we know..

something TiFKAS knows so well from personal experience. Especially in front of Macintoshes. Sometimes when they're even turned on! :)

The real truth is that
> he was taking the demise of future Amiga models by GateWay hard..

Bill has also since posted in mac.advocacy that he likes the specs of the new Milan II and he wants to see this new machine, as he feels it has potential, especially with Motorola's backing.

speaking of which, TiFKAS, weren't you a month or so ago braying that the new Gateway Amiga would ultimately crush the new Milan II?
HAHAHAHAHAHAHA!

well, well well. Number of Milans produced since August 1998 - over 50 per month (and still back-ordered). Number of past and future Gateway Amigas - ZERO.

Add that to the number of TiFKAS predictions that never came true. Still pucking blood over your gaff with Virtual Game Machine, "Sony will do a licensing deal", then when that didn't happen, "Connectix will prevail in court", ignoring of course the fact that Sony is a 500lb

gorilla with lawyers with no sense of humour. Even MacAddict have
pronounced VGS dead! More strained spinach, Cartman?

BTW, read the statement from the new head of Amiga Inc. yet? Probably
the most blatant example of weasel words and TiFKAS-speak I've ever read
in my life.

August 1998, Milan GmBH. Over 50 per month and still back ordered.

And as I have said before, TiFKAS not only can't tell his ass from a
hole in the ground, he also thinks he's an ostrich...
>
> Nobody cares about 1992 machines..

Centek and CORE do. Their new boards for video RAM and acceleration turn Falcons into lean mean fighting machines. Kin you say PowerPC?

And you should see what's coming even for the 1985 machines - there's a new SCSI/ethernet adaptor coming for STs that's just plug and play. I've seen the beta for the new PC keyboard/mouse adaptor on Wednsday as well, which includes some interesting driver software as well, and is designed also to be plug-in friendly - this is going to be one hot seller, as well as the new graphics board coming for the ST. Tell me, when was the last time anyone came up with such neat stuff for the same vintage Macs? Other than the fact they make nice fishtanks...

>1999 machines are half price...

tell me where to find these half-priced iMacs, which are just as imaginary as your claims that you're an "Apple Power Rep"....

the MagiC/Jinnee combination is better than good enough, but for those who want to use Linux it'll be a great option for those who want it. And of course, with Ataris, you'll be able to choose different operating systems as well for when you need them.

OS9 is still vapourware, according to your yardsticks. 7.5.5 may have had its problems, but it's still pretty good, and it's pretty stable on this Quadra 950 I've got sitting here in my computer room.

BTW, note that TiFKAS has called a Mac OS junk......

but an option that can be utilized and added if needed. Not like how Apple deliberately tricked B&W users to cripple their machines via an update patch that prevents them from adding G4s (and which Apple is currently trying to dodge the issue on)....

gee, TiFKAS, replying to one of your own pieces of drivel! Are your friends Johnny Walker and Jim Beam in the room with you? :)

>
> >   they'll have the drivers, don't worry.
>
> Decent drivers?

most likely written by ASH (MagiC' s producer), who have all the proper licensing from Epson, HP, Canon and Lexmark with all the documentation. If NVDI 5 is anything to go by, then they'll be great drivers indeed.

>

>
> But TOS will not be able todo what OS9 will do...Yesteryear's OS at
> today's packaging...

since by your own admission the only ST you've used ONCE was one of the
first ones with TOS 1, your opinion on what is modern in TOS is worthless.
Having been a MagiC user AND a Mac user in the last year, I'd say that
MagiC not only goes toe-to-toe with Mac OS, but in many ways leaves it in
the dust - and at much lower RAM and hard drive requirements.

> > > Still not OS 9 caliber...Maybe in 10 years..
> >

>
> Have you seen OS9?

ah yes, a kludge for Apple to buy time because they can't get OSX
Consumer out on time, I guess it's been over a YEAR now? Kin you say
COPLAND, boys and girls? Kin you say RHAPSODY?

BTW, it might not be a good idea to keep using the term OS9, as Apple's
getting sued by the owners of that copyrighted brand name OS...

>
> ClarisWorks is now AppleWorks and is alive and well. AppleWorks is
> bundled with iMacs and is sold on shelves...

Not on shelves in this part of the world, TiFKAS. Even the Mac dealers
here don't have it on their shelves, and I certainly can't find them at
well-respected business-related stores like Business Depot, Office Place,
Grand & Toy, etc. Plus didn't I hear that Appleworks is being
discontinued, since Bill Gates doesn't like to see one eensy-weensey bit
of independant marketing from his lapdog Steve Jobs?

>
> > >
> > > Is this a hacker or consumer machine?

Texel is consumer software, TiFKAS. So is Draconis Pro. So will be Smurf, the graphics program.

>
> > > >   - new games being developed!

cretins who can't even SPELL the term "a dime a dozen" aren't exactly pure gold either....

> >   It's obvious you didn't read the article, pinhead. Why weren't you
> > laughing when Jobs claimed that the G4 is a "supercomputer"?
>
> I did not see the details on these iMac toasting supermachines..

they're there. At the time of the writing they speculated that new machines would be based around the Coldfire chips Motorola developed which go up into the hundreds of megahertz. Of course, since that article was written IBM has opened the way for PowerPC to be used by manufacturers other than Apple. Imagine if Milan and ASH comes out with a TOS/MagiCMilan/Jinnee combination that utilizes the PowerPC, you'll really see TiFKAS sweat.
>
> The G4 is a supercomputer...What do you not understand?

I understand that Apple is basing their laughable claim on specs by the US government that are WAY out of date - the same specs actually made a Pentium II PC a "supercomputer" TWO YEARS AGO! But Intel had the sense to keep their mouth shut on that regarding reporting that to consumers, unlike Steve "arrogant bonehead (TiFKAS' own words, folks!)" Jobs, who has to coat every new product out there with his Reality-Distortion Field (tm), and has a history of using outdated specs to try to make his computers look good. Have we already forgotten his "iMacs can toast 450mHZ Intels" fiasco, in which they fudged their data using Bytemarks optimized for 486 PCs, and when PC magazines did their own tests using PROPER benchmarks, the iMac got its little plastic butt kicked by first-generation Celerons?

If Jobs wants to call his G4 a "supercomputer", then let him run it in real-time tests with a universally-recognized supercomputer - a CRAY - and then see what happens. Most likely the G4 would wind up looking like a real lump of charcoal....

>
> According to the latest 10k, that continent up by 40%....

which is still not good enough, unfortunately - apparently Apple's installed base of machines in Germany to date since the Mac was introduced is still far from one million. Atari achieved a one-million user base YEARS ago, and Amiga did even better. I think the factor here is that Apples still cost too much for the average German - money better spent on a Volkswagen or Opel.

>
> > >
> > > Germany is one of the 140+ countries on this planet.
> >
> >   no s**t, Sherlock. And it's one of the countries where the iMac is
> > seriously tanking.
>
> You sure...?

sure I'm sure. Indeed, I did figures on you "140 countries" claim, and according to that Apple averaged a sale of 14,000 per country over a year's period. Which means that somewhere on this planet, the iMac is tanking. Like in Germany.

> >   yep, just the same mealy-mouthed moron who pretends to be an Apple
> > Power Rep, and has proven that he doesn't know beans about the video

>
> I guess you have not read my response about Avid...

yes I have. You call mindlessly posting a press release that you obviously didn't read a "response"? And once again Particle Salad crushed you to guacamole
on what was wrong with the article, and even pointing out that the writer had the sense not to even compare the buggy, not-ready-for-prime-time, falls over on G4s FCP to Avid's professional systems...

If anyone has installed Linux on a Falcon030 I could use your guidance.

I am looking for HowTos and FAQ's/Walkthroughs on installing and make a stable build of Linux on a Falcon030

Thanks in Advance

MacOS 9 has been available for ordering from the Apple Store since 9-9-99.

Let me be clear on this: I loathe and despise what they did there.

However, Apple never claimed the machine was upgradable. The people most likely to buy a CPU upgrade for a machine that is under a year old are exactly the ones that Apple will sell the first G4's to. Apple needs enormous numbers of CPU's to get its product out the door. The upgrade vendors don't. There was a good chance that upgrade vendors might have G4 upgrades weeks or months before Apple could deliver G4 computers. That would have hurt Apple very bad indeed.

>of the now-non-cutting edge B&W G3s.....

Exactly, now-non-cutting-edge. The G4/400 (the bottom-of-line configuration) comes with a 10GB harddrive. And by the time this new Milan comes out, the next generation iMac should be out too. With a larger harddrive than the present ones, I dare predict. Besides, this is a consumer machine. Average consumers will have a hard time filling a 6 gig drive.

Not to buy time for OS X, OS X has been scheduled for early 2000 all the time.
And OS 9 is important as the last OS that be supported on pre-G3 PowerMacs. It
should provide good integrations with machines running OS X, kind of like System
6.0.8 did when System & came out.

>   BTW, it might not be a good idea to keep using the term OS9, as Apple's
>getting sued by the owners of that copyrighted brand name OS...

Yep, they're being sued by Microware. But the question will be wether they can
stop them from using the version number for their software. Remember why Intel
changed the name of the x86 range because they couldn't copyright the 486/586
number?

Ehm, AppleWorks 6 should be out soon... And every Apple authorized Apple dealer
can sell it to you.

No, it didn't. I doubt Intel would have left such a hige marketing-opportunity
unused. By the US governments standards, the PowerMac G4 is a supercomputer.
Period. Yes, the standard is outdated, and Apple are negotiating with the
government to have the specs raised so they can sell their G4 to "sensitive"
countries too. But they're not lying when they say it's classified a
supercomputer. That's advertising for ya.

Market-share and installed base are not directly linked. Apple's computers have a far greater useful life-span than Wintel computers. You stated yourself you have a Quadra 700 running MacOS 7.5.5. Usually installed base is measured by tallying sales and "correcting" that figure by assuming that computers over a certain age are no longer in use. That way, figures become (somewhat to very) dodgy and biased.

Computers are not usually bought off of the same budget as automobiles.

Gtx,
Joost.

Hi all

I'm a Milan user and i've been a Atari user since -86. I'm using W98 at work and i have two brothers that uses a Mac and both the big systems have some catching up to do in my opinion. Especially multitasking works much better (maybee that should works period) both on Atari systems and Amigas. And fileselectors, nuff said.

Cheer's J�rgen

Really it dont matter.

What I would like to do is use the Falcon to run Linux and Linux apps
(ie ftp services, mail, www, net scape, etc)

And maybe Wine (Windows emulation under Linux, said to be faster then
Windows itself)

I use AIX 3.2 on an IBM Risc machine at work, so I am fairly familure
with Unix, and to keep my Falcon Alive I just thing that Linux would be
cool to have on there.

Thanks

   problem is, ONLY from the Apple Store, then. Apple won't ship anything
from the Apple Store to Canada. They've been dragging their feet regarding
opening a Canadian Apple Store online for two years (last deadline was "by
May for sure!", but they forgot to say what year :) )

   uh, one problem there - apparently the "Yikes" machine (the 400 mHZ
model Apple released as a stop-gap before the Sawtooths come out) utilizes
the same motherboard the B&W G3 does. Would that not signify that Apple
intended that the G3 was designed to be upgradable to a G4 in the first
place?

   Of course, Apple never said "no, you can't upgrade this to a G4" either
when they sold the machine to the consumers. That would've been more
honest.

> will have a hard time filling a 6 gig drive.

that's the whole point - TiFKAS was basically playing "mine is bigger than yours" with me, and I called his bluff on what was available right now. Seeing as the target date for the new Milan is January, and seeing that it is supposed to be priced below an iMac, the iMac will still be non-cutting edge regarding hard-drive capacity. Besides, isn't it a little late now to be predicting a new iMac? Christmas sales are coming up, and they'd have to have it out way before Christmas to have an impact - the pundits were predicting an announcement on a new imac at the show in France, and they were disappointed.

You're probably right on consumers not filling the hard drive - but in an Atari's case, you don't need that much hard drive space anyway unless of course you're doing major DTP or graphics or video work. Since the specs of the new Milan II indicate that Milan GmBH is designing this machine for graphics and video, it's justified to have such a large hard drive to begin with (I worked with my Falcon with as much as 500 megs of available hard drive space and never even got to fill it, compared to the Quadra which is already requiring lots and lots of drive real estate - the 500 meg drive inside it is just not enough!)

uh, a problem - according to Macintouch yesterday, a vendor mentioned in announcing upgrades to a new product let slip the fact that as of now Apple has not shipped any betas of MacOSX Consumer out to developers. And it's also well known that the latest version of the OS was supposed to be known as OS 8.7 - the name change indicates that Apple wants people to think this is a revolutionary new OS. Hence, buying time.....

well, looks like I'll soon be able to buy a Mac 7200 for $79 :)

dealer
> can sell it to you.

since they can't seem to sell it to me NOW, I'm not impressed. TiFKAS stated that Appleworks "is sold on shelves". What shelves when even the Apple dealers don't have it? I haven't seen it at Computer City, CPUsed, Carbon Computing, etc. They may have the hardware, but the software selection at these stores is somewhat pathetic. They have DOOM in stock, oh how 1994 of them....

> supercomputer. That's advertising for ya.

that's all I needed to know - "The standard is outdated". Hence it's silly for Apple to call the G4 a "supercomputer". Period. Like I said, if Jobs wants to keep spreading his FUD about "supercomputers", then let him run public tests on what the public recognizes as a supercomputer - a Cray - against a G4 and let him honestly post the results of the tests up....

>
> Computers are not usually bought off of the same budget as automobiles.

but households have to decide what are more important, computers or
cars. And if the price of a computer is about the price of a hefty
down-payment for a VW, what are they going to decide? That's why the Atari
was popular in Germany over Apple for years - truly "Power without the
price", the same processor as a Mac for a lot less money. And that's why
the Milan, despite TiFKAS' FUD, has been doing so well for such a small
company with relatively small outlay at the start - they've come a long
way in the last year, and they're truly going forward.
>
> Gtx,
> Joost.

at least you are more honest about the situation as you see it - face
it, the Mac community is often tarred with the brush of being mindless
drones who hear and obey without question and shun any bad news. You're
certainly one of the ones breaking that stereotype, unlike TiFKAS, who
merely reinforces it....

sure, DarkChyld - straight from the horse's mouth at http://www.amiga.com . Their new president has posted another letter to the Amiga community clarifying the nebulously doublespoken September 14th letter, in which it confirms that they've dropped any thoughts of producing a new computer, and will now be using the Amiga technology with some business partners in producing Internet set-top boxes for TVs!

What was most ridiculous was in the September 14th letter was the statement:

"I hope you'd agree that Amiga was never about a box. It was never about an operating system either. Sure those things were part of what made the original Amiga great, but at its heart, Amiga was simply about a better way. Amiga was ahead of its time. Amiga promised to change the world. It ran against conventional wisdom and was better than anything out there at the time. In fact, we could all argue that it's still better than anything out there.

"The ideals and spirit of that original Amiga are alive and well today. But to limit Amiga to just one box, one product, one OS, is to keep Amiga from ever seeing its full potential. Think about it.... The original Amiga never did really reach its full potential despite its technical advantages and its cost and ease of use advantages. Why? Because it never became ubiquitous. The company's early vision was probably too limited for the vast potential that Amiga offered."

now isn't that the most ridiculous thing you ever read? And I thought only TiFKAS would try something that boneheaded to bamboozle their loyal users....

Can you guess as to WHY CompUSA is flushing itself down the toilet?

Ever check out that ^*#^& return policy that nobody else would dare offer to consumers?

Ever wait in line 40 minutes just to exchange a defective product?

Even when they had better return policies, you had to bicker forever to get them to give you cash back (which was more difficult than store kredit.)

Oh yeah, employees are stupid too. No the techniacl ones, I run rings around them but the clerks and counter clerks. The counter clerk told me I had a 10 day time period to return the video card for a FULL refund. (this incident happened 2 months ago). I returned it 2 days later but ran into a problem - they, after fighting, reluctantly gave me credit. What the F^ happened to this 10 day full refund sham? Who's lying?

Their cable prices are shit, too. Sorry but I will not pay $50 for an external SCSI cable (screw USB which is equally low-power and no-class and blew up in Gates' face so it'll become a standard) when Best Buy has the same frigging cable for $30!!!!!

KompUSA can rot. And I'll happily tell everyone my nightmare stories...

But at least Apple, who like KompUSA deals with crap, might go under if KompUSA does so I'm now doubly-happy.

Daniel L. Dreibelbis <dreibel@idirect.com> wrote in message

No Apple store in canada?? Sheesh... seems Apple Canada (is there such a thing?)
is even wordse than Apple Netherlands/Benelux (at least we have an Apple Store).

And yes, AFAIK, only from the Apple Store, since this is not shipping, but
taking orders.

But I wouldn't call it vapourware if they're taking those orders now.

>intended that the G3 was designed to be upgradable to a G4 in the first
>place?

Yes. It was built in such a way that it could (can) be upgraded. The move to introduce the "G4-block" was highly controversial, even within Apple (according to AppleInsider, whom I regard highly as one of the more trustworthy AppleWatcher sites). I have little doubt that a next issue of the Yosemite ROM will be released soon to resolve the issue. Apple did this, as I said, to ensure that they would not be beaten to the G4 market by too large a margin.

There have even been rumours that the block was imposed by the US government, to ensure that the same sensitive countries that can't import the PowerMac G4 can't build their own either. This is cotswallop, IMO. As I said in my previous post, Apple are negotiating with the government to get the export-ban lifted.

Even though the low-end G4 model is based on the "Yikes!" architecture, basically a modified Yosemite (B&W G3) motherboard with a G4 processor, and is regarded by the Mac community to be a "non-buy" because the *real* G4 (Sawtooth) will be out in weeks, this is the one to go for if you need immediate G4 power. Thsi is exactly the market that would have bought G4 upgrades for Yosemite machines. By buying a Yikes! machine (an Apple-upgraded Yosemite, if you will), they ensure that they also have Apple's support if anything doesn't turn out the way they expected. That is worth a lot to some people.

>   Of course, Apple never said "no, you can't upgrade this to a G4" either
>when they sold the machine to the consumers. That would've been more
>honest.

I agree. But Apple is not responsible for doing that. Apple is a business, not your neighbour doing you a favor by selling you his computer. You can't bash Apple for blocking an upgrade for its machines. You can bash them for doing so in a sneaky way.

I was one of those predicting the launch of the new iMac for the Paris keynote.
(although the keynote not being webcast by Apple was somewhat of a clue it might
not be very spectacular.) I was very disappointed. I don't know of any major
events in the near future that would provide a good opportunity for the launch.
I'm sure they will find one, though.

It would have been nice also to give the European Mac-market something, too.
They've been saying there are 4 major Mac-events now (SF, NY, Paris, Tokyo), but
only the american events get the big splashes. Apple need to address that to
build more confidence among their non-US customers. The CEO actually doing a
keynote overhere was a step in the right direction, but not a big enough one.

Ehm... Developer preview was seeded in may, at the WWDC. The vendor in question was probably peeved off that they didn't give a preview to vendors as well. I know I would have liked to have one... The second preview is to be released any second now. That might be the final one, as even the first one had pretty much all the features of the final release implemented.

Then there's the little issue of OS X server... This is widely regarded as a "very public" (and very expensive) beta for OS X. Apple might have released this "bare-bones" OS X also to build confidence, especially needed after the debacles of Copland and Rhapsody.

Mac software is notoriously scarce on shelves. Apple really oughta push vendors more. However, that still doesn't make AppleWorks "dead".

Honesty and marketing don't go together very well. Advertising isn't about telling the truth, it's about not lying so you can't be sued.

There is a spec (even if it is hopelessly outdated) that classifies the G4 as a supercomputer. So market it as being a supercomputer. Simple as that.

>way in the last year, and they're truly going forward.

Germany is one of the largest economies in the world. (And used to be one of the strongest :) It is also one of the more automobile-centric countries. I very much doubt that any German household is gonna decide on wether to go for a downpayment on a Volkswagen (or a BMW or Mercedes) or a computer. Most will buy a car anyway, and if there's money left over they'll buy a computer too. Now a couple of years ago the price difference might have attracted many people to Atari over Apple, but these days... Most if not all of Milan's computer are probably sold to Atari die-hards. There are a lot (I mean a *LOT*) of those in Germany (and in Europe in general, Holland, England and Poland are strongholds too). So sales-figures of 50+ a month don't strike me as odd at all. But I think they don't come out of Apple's marketshare.

Gtx,
Joost.

Wine Is Not an Emulator. (hence WINE) Unless something has changed very
recently it will only work on x86 machines, which rules out the Falcon.

One thing of interest I read in the local paper was that none of the Apple
Trained CompUSA people were going to be included within the 1800 head
count. Seems only the PC side of the store was getting hit.

well, you know that when they announced the plans for the Linux-based Amiga, someone likened the effect to dropping an atomic bomb on amiga.advocacy. This latest bit of bad news I liken to being like Nagasaki after Hiroshima.

Even more interesting - two-three weeks ago, Jim Collas, the architect of the new Amiga and president, abruptly resigned from Amiga Inc. and at the same time dumped all his Gateway stock. This was followed by the sudden disappearance of the planned new Amiga details from amiga.com and a letter from management stating that an announcment would be forthcoming...

stranger things have happened. I'm personally looking at sending his original letter off to the National Council of Teachers Of English as a nomination for the year 2000 DoubleSpeak Awards. Amiga's new president probably is the worst official mangler of language for them since General Alexander Haig sat on Amiga's board of governors (Gen. Haig won his own DoubleSpeak Award in 1981 when, in testifying to a House Investigations committee how three nuns and a lay worker were killed by soldiers in El Salvador, Haig claimed that the nuns "were probably trying to run a roadblock" - and even hinted that the nuns were involved in a blazing gun battle! - which he then denied he ever said to the Senate Investigating meeting next day!).
>
>   You sure TiFKAS didn't help pen that message? <grin>

I'm sure he could've, and then the secretaries at Amiga Inc. translated it from the original crayon :)

like his inability to spell - or his boneheaded predictions that go wrong - or his utter cowardice in dealing with Particle Salad's unmasking of the fact that he doesn't know beans about how the video industry works - or being caught with his pants down with his bogus "facts" about Ataris - or his outright refusal to post any evidence that he's employed by anyone associated with Apple, using the lamest of excuses - or, when he is obviously losing the debate, starts hallucinating about his imaginary friend "Chunks", or claiming he's a "macho stud"....

>
> > Or he could be yanking your penis for all we know..

actually to be fair to Bill, he's admitted that his post was meant as parody, and he has apologized to any and all Atari users he may have offended - he also said he really wants Milan II to succeed, as he's impressed with the specs of the new machine. Apology accepted, Bill!

Now compare that to TiFKAS, who has of yet not apologized to anyone regarding his steaming piles of drivel and his abusive behaviour towards anyone who uses any form of Atari despite being confirmed as a total uninformed schmuck over and over and over.....and funny that he seems to be obsessed with "little Peter".

THAT'S for sure, but considering the upgrade from the origional specs of
my machine to ones that could actually run the game were half paid for by
MacZone in a promotion, It only took a 3Dfx card to complete the puzzle.

I just hope when I upgrade to run Halo I can be as lucky.

It's not how much you must upgrade, it's how much you can get for free!

TOS is ROM loaded, and most Atari users will use MagiC, MiNT, n.aes or other multitasking systems rather than TOS, so why you keep harping on about TOS I fail to comprehend!! At least we don't have to buy an OS as well as the computer...

Maybe you should try Linux one day too...and see actual multitasking for the first time...

My folks have Clarisworks Office 5 on their Mac (Asia/Pacific version).
The word
from Apple is that they will not make a free upgrade downloadable from their
web site for that and other nationality versions of Clarisworks. Only
the US
version is being supported currently...the other versions will NOT get an
upgrade, and it looks like you'll need to buy outright AppleWorks 5.03
if you
don't have the US version of ClarisWorks...

Sucks the big swordfish if you ask me. Fancy not supporting a piece of software
you now own...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Well, I have not installed Linux on a Falcon, but I am in the process of installing it on my Hades, so the process should be the same.

Although there is now an unofficial port of Red Hat to the M68K platform there are currently no installation utilities for the Atari so your best bet would be to install the Debian distribution.

You will find information on installing Debian on the Atari platform on their WEB site. http://www.debian.org

You will also find a list of suppliers on their WEB site so you shouldn't have any problems getting hold of a copy. You could also look at the Whiteline Linux CD's which are basically Debian.

http://www.atari-world.com

Hope this helps.

Regards,

Ben Hills.

What's all this Atari and Amiga talk?  I have an Atari 2600 from 1976
and we used to play computer games on a Commodore 64 (that's 64K of
pure muscle!!!).   I thought Commodore and Atari's computer lines went
out with the Reagan administration... what am I missing?

Hmmm...I was confused on the CPU on the card/legacy system interface thing.

I suppose you're right.

With everything on the same card I wouldn't think there would be any bus speed issues, the whole deal is on one card and the slower system bus is only used for the legacy graphics subsystem and any ZorroII cards that can't be replaced by PCI cards. The bus speed can be the same as that of a Mac can it not?.

My apologies to you too Bill. The thought of sinclaps sweaty palm touching anyones wedding tackle other than his own is not very nice...realistically his own wedding tackle is likely the only he'll touch both male AND female...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> out with the Reagan administration... what am I missing?

About 15 years!! :)

Atari themselves produced computers right up until the mid 1990's, but
clones of high end Ataris still are sold and developed today...

Here is a (small) summary of Atari computers from 1985 onward...

ATARI ST (released 1985 to 1990)
   -Based on MC68000 CPU at 8MHz (or 16MHz on later Mega STe model)
   -Upto 4MB of RAM.
   -720kB disk drive (upgrade to 1440kB).
   -mouse driven GEM desktop GUI.

-320x200x16 colours, 640x200x4 colours or 640x400x monochrome video modes on TV's, or dedicated colour or mono monitors.
-3 voice monoaural soundchip on all, PCM stereo chip on some.
-MIDI/harddisk/printer/modem/joystick ports

ATARI TT (released 1989)
-Based on Motorola MC68030 CPU at 32MHz
-Upto 128MB or more of RAM
-increased video resolutions (1280x960x monochrome capable)
-SCSI hard disk interface as well as all other ports you can think of
-PCM stereo sound.

ATARI Falcon030 (released 1993)
-Based on MC68030 CPU at 16MHz (faster with upgrade)
-Upto 16MB RAM standard (more with upgrade)
-high-colour video capable (65536 simultaneous colour on-screen, more with static image viewer)
-DSP56001 Digital Signal Processing chip. Capable of 96MOPS (96 million processor instructions per second)
-SCSI-2/DSP/LAN/serial/printer/analogue joypad ports

Several TT clones are around now that range from machines using the original MC68030 CPU but at faster speeds, to newer variants using the latest Motorola CPU from the same family, the MC68060, which at 60MHz equals a Pentium 200 in performance. Dual 68060 Falcon clones with high-speed DSP and more are also being developed. The MC68060 can be clocked to around 90MHz now, but expect 120MHz versions within 6 months from the info we know from Motorola...

Atari Corp are certainly not an active business but the machines they created continue to be used by thousands, and newer variants are being developed by companies interested in the platform.

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Gateway Ends Plans For Next-Generation Amiga PC

SOURCE: Newsbytes
DATE: Tuesday, September 21, 1999

--

SAN DIEGO, CALIFORNIA, U.S.A., Newsbytes via NewsEdge Corporation : Gateway Inc. [NYSE:GTW] said it has scrapped plans to introduce a new and much- anticipated Amiga computer early next year and instead will focus on licensing the Amiga operating system to the Internet appliances market.

The announcement comes just two months after San Diego, Calif.-based Gateway, which owns the patents for the Amiga PC, promised Amiga devotees that they could expect a next-generation version of the Amiga by early 2000. The new computer, known as the Amiga Multimedia Convergence Computer (MCC), was to feature a hardware and software platform that included Internet access, digital video support, three-dimensional (3-D) graphics, broadband capabilities, and home networking standards.

But the company changed its strategy after reviewing product plans in the wake of the abrupt departure last month of Amiga President Jim Collas, said new Amiga president, Thomas Schmidt.

"To be honest, the ability for us to deliver the MCC was unrealistic," Schmidt wrote in a letter addressed to the Amiga community and posted on the Amiga Website. "I have fundamentally decided that it would be better to partner with a wide variety of hardware partners, rather than compete against them with a product of our own."

Schmidt added that he remains committed to seeking out partners which are interested in developing a next-generation computer and operating system. In the meantime, Schmidt said, Amiga will work with hardware manufacturers which want to license its technology.

Amiga officials did not immediately return calls for comment on the change in strategy.

Amiga's devoted fans were quick to express their disappointment about the news on various Amiga-centered chat rooms. "What does this new direction have to do with the original Amiga computer? Quite honestly, nothing! (I don't know) why they still need the Amiga name," read one message posted on a Czech Republic Website on Amiga news.

In 1997, Gateway bought the patents for the Amiga PC, which was introduced 14 years ago as an alternative to the IBM and Apple Macintosh computers. Sales of the Amiga, which was known for its ability to smoothly process video and sound, declined after its company, Commodore Electronics, went bankrupt in 1994.

Cows, bullshit, Gateway... what else did you expect from that Billy Boy
controlled company.

Nothing has changed, Phase 5 are going to release their Amiga clone and the
Boxer is already available.

Regards,

Clockmeister.

So then IBM can't copywrite OS/2? Somehow I don't think so. After
all Apple can use the name "MacOS 9" or "MacOS version 9" or

"MacOS 9.0" without violating any copywrite. Using "OS9" is using
more than just the version number.

here's something I found in mac.advocacy - a nice definition of those who sorely lack lives on USEnet. Certainly reminds you of a certain lifeless troll here, doesn't it (You know who I mean, the guy who pretends to be an "Apple Power Rep"....)?

>Windows users usually advocate no such thing. They
merely
>believe Windows gives the best value for the general
>purpose desktop.

I'll go with this statement if modified -- many windows users, I feel, are as comfortable with their OS/platform choice as most mac users are.

However, you and your ilk are NOT the average windows user, purposely coming over to "enemy territory" to perform "pre-emptive strikes" against "those dangerous mac users".

In case you don't realize it, most us are here talking about our platform, not in windows groups yammering about MS software holes or wintel gotchas. Mac users who go about doing that are at the same pitiful level as you all have dragged yourselves to in your crusade to eliminate the use of alternative operating systems.

In the movie Terminator 2, the John Connor (kid) character uses a small portable computer (looked similar to modern WinCE devices, in terms of formfactor) hooked up to a credit-card-like device to hack PIN numbers for ATMs/etc to get easy money. There is a brief flash where you can see the Atari symbol on the computer above its small QWERTY keyboard.
     My question is, does it exist, or is it just some sort of bizarre joke or bizarre product placement? Since I can't find any

```
reference to such a device, I figure that Atari never made a handheld
computer (Lynx doesn't count, no keyboard), but if Atari ever made such
a device, I'd love to know about it.
     Thanks.

Can you use W98, Navigator 4.6 and IE 4.5 on the Amigas and the TOS
buckets?

Did you check the back of the reciept for the return policy? Did you ask
for a copy of the return policy? CUSA has a 14 day defective return
policy. Bring it in for a replacepent. If you want your money back,
it's a 15% restocking fee. Educate yourself and you will be a informed
consumer..

Fry's are commission based...Fry's can give a salary instead but prices
will go up...What do you want...low prices or high service and high
prices?

well, after a couple of months, here's some more news on the upcoming Milan II '060 clone planned for release in early 2000 - which, by the way, confirms Motorola's involvement in the manufacture of the machine, as well as who will behind the distribution and promotion of the new Atari-compatible computer! Plus some new highlights:

- new distribution of Linux being developed for the Milan!
- a Macintosh emulator for when you HAVE to use a Mac program!
- three ISA ports!
- four PCI slots (for using industry-standard PC cards, kin you say FIREWIRE?)
- two USB ports for connecting those funky new devices!
- 8.4 gig Maxtor hard drive standard!
- Creative Labs video card!
- 32 mB RAM standard!
- MagiC Milan with Jinnee 2 desktop standard operating system/GUI!
- includes NVDI, PiXArt, fax software, Draconis Pro Internet suite, Omikron Basic + GNU C++ programming suites
- new games being developed!
- plans for even faster Milans in the future (including iMac-toasting super machines)

PLUS! (for a certain trollish "kook" who maskerades as an "Apple Power Rep"), the reasons why the the overpriced, overhyped, underpowered iMac tanked in the German market place, and why the new Milan is better poised to be a success in Europe (of course, he'll claim that it's all a plot by the imaginary Atari "Jihads" who are "out to get him", when they're really hallucinations caused by methane, which has been building up in the Steve Jobs Reality-Distortion Field (tm) he's been trapped inside for the last few years). REAL computers don't come in fruit flavours!

Intrigued? check out this URL:

http://thor.prohosting.com/~bengy/m_milanii.htm

and afterwards, let's stick a fork in TiFKAS to see if he's done. (An apple in his mouth would've been a nice if perverse touch, but that would be impossible to do seeing as he still has his head stuck in another orifice....)

Agenda for the Toronto Atari Federation Meeting, September 15th, 1999

We start the beginning of the TAF meeting season by taking a look at programming! Always wanted to design a program? Do you want to find a way to get your Atari to do something it previously couldn't. Not impressed with what TOS programmers have done and think you can do better? Tonight we'll give you an idea on how to go about it! We'll look at the different programs out there for designing and assembling your programs, including GFA Basic, STOS, and Sozobon. Be sure to ask lots of questions!

Also - Ken MacDonald, TAF's intrepid president and North American distributor of Mario Becroft's hardware solutions, will be demonstrating how to install the IDE board inside your ST's case to allow for program storage without funny boxes outside the case, plus news of new Becroft developments like the AT/serial mouse adaptor of attaching PC keyboards and mice, and a new dongle that will provide both SCSI out and Ethernet for stock STs (two words: CABLE MODEM).

It's going to be an informative and fun time at the next TAF meeting! See you there!

UPCOMING TAF MEETINGS:

OCTOBER 20TH - Graphics and Graphic Design
NOVEMBER 17TH - The Famous and Amusing TAF FLEA MARKET!
DECEMBER 15TH - CHRISTMAS PARTY + MIDI Entertainment

TORONTO ATARI FEDERATION is dedicated to the preservation and continued use of the Atari 8-bit/ST/TT/Falcon line of computers, users of the Hades and Milan clones, and users emulating these platforms on Macs and PCs. Meetings are held on the Third Wednsday of the month from September to June in the North York Community Hall on the Lower (or Concourse) Level of the North York City Centre Library at 5110 Yonge Street at Parkholme Avenue. Parking garage inside the complex. Those using public transport can take the TTC's Yonge/University/Spadina Line to North York Centre Station. Meetings start 7:00 PM, $2 to non-members. Membership is $25 a year, and includes a subscription to the PHOENIX newsletter. A membership in TAF IS Atari support!

   I don't think there's any chance of that happening, seeing as Jack
basically drove Atari Corporation and JTS into the ground, and sold off
Atari's intellectual property to Hasbro for a pittance. Let's face it, the
Tramiels couldn't market immortality :)

It's a better idea than switching off the PC. (No, it won't reboot without
a three pin reset)

Only because Mac software, before PowerPC machines became common and faster, was more efficient and not just bloat. Now with G3's and soon G4's software houses can get away with bloated sloppy code that simply overwhelms lesser Macs. They've gotten lazy at writing compact efficient code for Macs...just like PC. These poor Macintosh owners upgraded because their old machines couldn't run any new software fast enough to be useful. I still haven't seen many software packages that make me go 'wow on a Mac yet.

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

This needs interpreting? Listen carefully and concentrate on your
comprehension OK? This means that if a retail appliance store had
10 sales people, you would tend to find that only 2 or 3 of those
sales people were able to sell appliances succesfully. The others
would sell enough to get by but not get ahead...got it?!

Here is some more comprehension for you. This could explain the
'limp appendage' issue for you (I dearly hope!). A man who is single
in New Zealand, when he goes to the toilet to pee, is said to be
'shaking hands with the unemployed'...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Whoa! Would Dell Dimension with Quietkey keyboard be one of these? My keyboard would lock about once a month for no apparent reason and I do have an Intellipoint mouse. The keyboard lockup required a power cycle to fix (never tried hot-plugging the keyboard). Problem went away when I replaced the Quietkey with a genuine IBM PS/2 keyboard because I liked the click (got the complete PS/2 Model 55 for $12 at a yard sale).

Ok, so maybe I won't need the other. I think I'll download a trial of
Perfect Screens.

> Suppose the mouse pointer accidentally falls on one of the background

> concern me since it doesn't affect anything by default) it pops up
> uninvited.

My usual setting in X is "sloppy focus". Moving the pointer out of a
window doesn't change focus unless it hits another window rather than
the background. And "focus" doesn't mean "raise" in X, so nothing "pops
up uninvited" even if you touch another window, although you can find
yourself typing into the wrong window sometimes.

FeelX (Xfeel? I can never remember which it is) works this way too.

> Anyway, different strokes.

Yup. X is much more flexible than stock Windows in this respect.

I imagine that at some point, a Nuon system will show up but, much like the Pippin, will quickly and quitely fade away. As I've last heard, Vmlabs is trying to get someone, anyone to put the Nuon in a high end DVD player or some super set-top-box game system. However there are problems with that.

Right now the trend is getting DVD players as cheap as possible. Last year the industry said that DVD players wouldn't sell below $250 till christmas 2000. That make was blown last Spring and now you can get a DVD for around $200 on sale. No one is interested in adding even $5 to the cost of a DVD system.

As for a game system, The Nuon chipset can hardly compete with the Dreamcast, let alone the Playstation 2 which is due out in months. Not even talking about the Xbox or Nintendo's Next Gen.

Dunno, depends on the internals of that keyboard I suppose. The ones we had
problems with were fitted with a collection of hotkey buttons for
multimedia use. CD start/stop/pause etc.

> My
> keyboard would lock about once a month for no apparent reason and I do

The lock up problem is documented apparently, Personal Computer World
made mention of the issue shortly after the mouse was released.

> The keyboard lockup required a power cycle to fix (never tried
> hot-plugging the keyboard).

Suggested test for the problem when we phoned the PC manufacturer - who
would have replaced the whole PC if things got totally wazzed.

> Problem went away when I replaced the Quietkey with a genuine IBM PS/2

Sad case.

> (got the complete PS/2 Model 55 for $12 at a yard sale).

Um. We still have about 50 in use... ...only as cheapo terminals for
Telnet connection into an HP G40K UNIX box though.

So all major computer firms should be like the defunct Atari and
stagnate technology like? Should Sega had not released DreamCast due to
the fact that games are larger and need a CD/DVD format instead of
cartridge format?

We Mac users like update and cheap hardware like the iMac and the new
G4/400. I suspect most of the ST buckets are collecting dust in the
attic while much of the owners have moved on to greater things on the
mac/pc platform...

Sounds like sour grapes here...

CUSA does not sell appliances. Could it be the $500 PC's that have done
the harm?

From experience? Here in the U.S. unemployment is almost non-existant
thanks to the stewarship of the Clinton WhiteHouse..Maybe New Zealand
should have their own Clinton's...He will be missed on Jan. 20, 2001...

Sounds like the old Atari management is in charge..History does repeat
itself. What products would these DVD chipsets be used for?

You're right, in 10 years the Mac OS *might* catch up th the ease of use, and functionality of modern Atari system software. I played with the iMacs and G3's at CompUSA for quite a while the other day. None of them had any thing that I found wanting in my MiNT/N.aes/Thing setup. In fact, I could not find anything as slick as Freedom�, the penultimate file selector!

I just want to run a casual, informal online survey here. Would all former Atari users who have switched platforms, to the Mac, directly because of Sinclaps posts/arguments, please post here.

Also, to be fair, would all those users who have decided to never own a Mac because of Sinclap, please indicate this in a follow-up as well...

PS Let me start the ball rolling by saying I'll never own a Mac, and
   it is directly because of Sinclap...

;-)

   nope, uses OS 7.5.5, which you can get FREE. Not as bloated as current
vapourware.
>
> >   - three ISA ports!

> Playing catch up..

nope, again, cutting edge. I believe the iMac only has a 6 meg hard drive?

>
> > - Creative Labs video card!
>
> Lets hope the drivers are written..

yep, there will be drivers. fVDI (already used with the CORE Eclipse card for the Falcon, which uses a Rage card, same one as the iMac) is designed for use with several industry standard graphics cards.

>
> > - 32 mB RAM standard!
>
> Not 64?

nope, since TOS and MagiC were designed for efficiency, unlike the bloated Mac OS that needs a fast chip, buckets of RAM, and large hard drive just to install the minimum requirements. On my Falcon it just required 4 megs of memory and about three megs of hard drive space...

>
> > - MagiC Milan with Jinnee 2 desktop standard operating system/GUI!
>
>
> Still not OS 9 caliber...Maybe in 10 years..

yep, the MacOS needs to catch up with the elegance of MagiC/Jinnee....

Clarisworks is dead (probably by decree of Bill Gates, who threatened to cut off Apple's oxygen supply again?). I believe Texel will be bundled with the Milan as it was with the original.

>

> Did not Apple post double digit gains in Germany thanks to the iMac and
> G3's?

   no it didn't. Indeed, the article goes on to say WHY the iMac tanked in
the German market, and that the Mac has a very small user base due to the
fact they're overpriced.

>
> Germany is one of the 140+ countries on this planet.

    no s**t, Sherlock. And it's one of the countries where the iMac is
seriously tanking.

>
>
> Just sinclap..

   yep, just the same mealy-mouthed moron who pretends to be an Apple
Power Rep, and has proven that he doesn't know beans about the video
market, no less computers....

> Sent via Deja.com http://www.deja.com/
> Share what you know. Learn what you don't.

   what TiFKAS knows - NOTHING. What he is capable of learning - NOTHING.

Undoubtedly some have moved across to Mac/PC, while some still span the gap between Atari -> Mac/PC, but there still seem to be a large number of us using these comp.sys.atari.* newsgroups...maybe that means we have good reasons to stay with our Atari machines...

> Sounds like sour grapes here...

Not at all. I can and do use Atari, Mac, and PC, yet I prefer my Falcon
because software on that is faster than ever with each new release. On
the Mac (new only 2 years ago) every new software upgrade has left me
wondering if the CPU clock is progressively being slowed down! Software
bloat is the reason. As an example I grabbed a demo of Star Wars - The
Gungan Frontier a few days ago...it swallowed 50 Megs of the Mac disk
yet was a basic 'walk-through' with only a handful of the full features
included. It looked like a pretty cool game but I'm sure any decent
Falcon coder could do the same in 5 megs...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Not desperation. Fact. A 1992 Falcon running MagiC will multitask
Mountain and Photoline together better than a 1992 Mac (even one
using Mac OS 8.x) trying to run Photoslop and FCP together...

In fact when Apple sort out what multitasking is get back to me
and we'll do a fair comparison, because I guess MagiC leaves
MacOS dead in the water when it comes to multitasking...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

>included. It looked like a pretty cool game but I'm sure any decent
>Falcon coder could do the same in 5 megs...

Nonsense. It's not code that makes modern games large, it's content. Few
games have more than a megabyte or two of executable code. High
resolution 16- and 24-bit images, high quality sounds, and high polygon
count models in 3D games suck up a huge amount of space. If there's
anything to blame for this, it's the CD-ROM, which let game companies
vastly increase the amount of content they could deliver with a game.

Just for example, the Quake 3 Test (Mac version) application is 992 KB. The PAK0.PK3 data file for q3test is 63.5 MB.

Demos are also often larger than they need to be since they're pushed out the door either during crunch time or after the game has shipped. In the first case nobody has the time to really strip down the demo version as much as it should be, because they're too busy getting the real game finished. In the second case nobody cares any more, and the schedule is tight anyways since they want to get the demo out as soon as possible to help market the game.

Now, you want to complain about bloat in word processors and the like, there you might have a case.

However, I'd bet good money that the Atari platform would suffer the exact same problem if it weren't for the fact that the last time Atari itself released a new computer was what, 1993? (Or was it '94? Can't remember.) It's very simple; the lack of hardware advances means that software authors target only what's out there. Yes, there are now faster Ataris, but I doubt they are anything more than a drop in the bucket compared to even the Falcon. You can't even think about something like Quake 3 for the Atari platform; the hardware just isn't there. You can on the PC and Mac, so it happened.

uh, I don't know how to tell you this, but there IS a new TOS-based machine coming out early in the new year - and ironically enough, Milan GmBH IS in negotiations with Hasbro's US operations to license the Atari name and Fuji logo. The machine has a number of new features:

- new distribution of Linux being developed for the Milan!
- a Macintosh emulator for when you HAVE to use a Mac program!
- three ISA ports!
- four PCI slots (for using industry-standard PC cards, kin you say FIREWIRE?)
- two USB ports for connecting those funky new devices!
- 8.4 gig Maxtor hard drive standard!
- Creative Labs video card!
- 32 mB RAM standard!
- MagiC Milan with Jinnee 2 desktop standard operating system/GUI! (note - pre-emptive multitasking)
- includes NVDI, PiXArt, fax software, Draconis Pro Internet suite, Omikron Basic + GNU C++ programming suites
- new games being developed (including what sounds like ports of some more famous games)!
- plans for even faster Milans in the future (including iMac-toasting super machines)

oh, and did I say that Motorola themselves are taking part in the development and manufacture of the machine? Plus the fact that Milan GmBH's previous clone, the Milan 040 model, has been selling 50 machines a month since its release a year ago, and are still back ordered - not bad for a small just starting out operation from Germany, and what obviously got Motorola's attention.

the full story is at http://thor.prohosting.com/~bengy/m_milanii.htm

Never thought I'd have to defend this particular platform in THIS forum :)

Looks like Bill Gates will be up at night dreaming up ways to cut off this company's oxygen supply :)

This is not correct. VM Labs does not intend "NUON enhanced" DVD players to be more expensive than the old DVD players. The intention is for them to be the same price - to be competetive, and to eventually be considered to be standard for DVD players. They hope that in the future all DVD players will have the NUON chip in them. The reason the "NUON enhanced" DVD players are not supposed to be more expensive than current models is because the NUON chip is a substitute for the chipset that all current DVD players have anyway (current DVD players need processing power to decode the compressed video data on DVDs).

Also, the NUON is much more powerful than the Dreamcast or any other game system. I don't know the technical details of how the NUON works (I don't think the info is available - it's confidential), but based on what has been said about it, it sounds like it uses technology similar to "reconfigurable computing". Do an internet search for "reconfigurable computing" to understand what this means - I don't want to write a long explanation here. The reconfigurable computing concept is clearly the wave of the future. It replaces the standard processor paradigm, where all computation is done with a single group of hard-wired machine instructions (you know, the instructions processors like the x86 have that you use when writing an assembly language program - stuff like "mov", "sub", "div", etc.).

Check out the following link. All standard processors are obsolete (Pentium, G4, etc.).
http://www.starbridgesystems.com/home/index.htm

Their computer is 60,000 times faster than a Pentium. It's available now, but it's expensive. They say they will sell them for about $1000 though in about a year from now. It can be expanded in power by adding chips (not multiple processors) that all act like a single re-configurable processor. Systems that use multiple standard processors (Power PC, Pentium, etc.) are obsolete. Adding more processors is just a hack anyway, not elegant or intelligent at all. Read the stuff by Star Bridge systems.

We have a box of old ones with no conceivable use. Don't know how many in
there because we can't be bothered counting.
When the kit finally goes (soon) the whole lot is skip filler.

nope, this isn't TiFKAS' doing - this is another guy on comp.sys.mac.advocacy doing a pretty accurate impression of the ol' boy. And so far, he's taking his lumps from the other Mac and PC users, who are way more intelligent. Which will be the same fate for TiFKAS if he decides to post there....

Granted, but in many cases I cannot see how so much data translates into
so little graphics or sound...have the programmers used incompressed TGA
to present graphics or something silly like that?

Games are one case, but applications such as DTP and graphics are another
where I see huge bloat occuring over the last few years, moreso on PC but
now also on Mac. I believe it all comes back to the 'grow the software big,
and invest in hardware stock, because hardware sales will go through the
ceiling just so people can run this large new software' philosophy that
Microsloth started with the release on Windows95...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

I wonder how much the shipping to the US would be? Probably more than
the cards would cost at a flea market I suspect...

found this at comp.sys.mac.advocacy. Apparently it's not just TiFKAS' posts that smell funny....

LOL!

http://www.salon.com/tech/log/1999/09/15/mac_smell/index.html

Eau de Mac

Apple's new G4 has a sleek look -- and a strange scent.
- - - - - - - - - - - - -
By Janelle Brown

Sept. 15, 1999 | If the prestige scent of the past was the rich, leathery perfume of a brand-new sports car, perhaps today's olfactory status symbol is the smell of scorching plastic.

The Mac G4 is the most recent computer to come off the Apple assembly line, a zippy silver-and-gray workstation that runs on a new Motorola processor, and the latest must-have machine for Mac fanatics. But the stylish computer comes with an unexpected feature: It apparently smells terrible.

A recent review of the G4 on the MacInTouch site for Apple news commended the new machine for being "pleasantly quiet," but also noticed that the computers had an unpleasant odor when turned on. The reviewer wasn't the only person to notice the G4 stink: This little bug has also been documented by the Apple Tech-info library, and filed under "Odors May Be Present Short-Term."

According to Apple, a plasticky smell will occasionally waft up when the computer is turned on and allowed to warm up to its "operating temperature." As Apple placates concerned owners, "the odor is detected when the product is new, similar to odors generated from new carpeting or a new car. In most cases the odor will dissipate over a short period of time." But the only quick solution, the site says, is to turn your computer on and leave it running for 24 hours or more, effectively burning off the smell -- and filling your room with a wallop of a stench that could last several days.

Ah, the smell of hot plastic in the morning ...

The demo of Star Wars - The Gungan Frontier was limited in what
was able to be done, and only 2000 Gungans were allowed to be created
before the demo quit...

I also shall have you know that I am a highly skilled completor
of games!! :)

Do you know anyone who has completed Abes Exoddus on Playstation
WITHOUT taking a break? I do!! ME!! Mind you I thought I was nuts as
it took a couple of days with nothing but potato chips and fizzy
drink to keep me awake that whole time!!

You're kidding right?  OS9 is bullet proof compared to the crash prone
System 7.5...Not one of Apple's rainbow day's...

Still an extra option which is standard on all G3 and G4!

 > Do have the drivers? I don't think Epson and HP will write drivers to
a

Decent drivers?

True. But the current iMac was introduced in April...

But TOS will not be able todo what OS9 will do...Yesteryear's OS at
today's packaging...

> > Still not OS 9 caliber...Maybe in 10 years..
>
>   yep, the MacOS needs to catch up with the elegance of MagiC/Jinnee....

Have you seen OS9?

ClarisWorks is now AppleWorks and is alive and well. AppleWorks is
bundled with iMacs and is sold on shelves...

> >

Consider that a 640x480 24-bit image takes 921,600 bytes, or just about a megabyte, uncompressed. Few games are going to use a lossy high compression ratio scheme like JPEG; at best they're going to use PNG (which, by the way, is actually what the game I'm working on with some friends does). And compression only helps on the disk side of things; usually images are stored completely uncompressed in memory because it might cost too much CPU time to uncompress on the fly, particularly in action games where the action should not stop or stutter.

16-bit stereo sound at 22.050 KHz (pretty much the minimum standard today, although I bet a lot of games even go for 44.1 KHz) eats about 86 KB per second of audio. It doesn't take much music or sampled speech to start racking up a large quantity of data that way.

Games frequently also have opening and closing cinematics. That can easily chew up 100-200 megabytes all by itself.

It works fine with SP5 and doesn't seem to have problems with the
other apps that I run. I don't use XFeel so I can't comment on
it. What's XFeel anyway? :)

>

It's not just typing in.

Say for example, you're copying _some_ files from one window to another
window (under Windows). When you drop the files in the destination window,
this window pops to the front. If it obscures the source window, you've then
got to do _something_ to get it back.

With RiscOS, you can drop the files in the destination window, and keep the
source one at the top. So long as _some_ of the window pane is showing, you
can drag the files there.

In addition, you can drag windows from _behind_ the stack, as though it were
a sheet of paper, so you can see a _bit_ of it, and then put it back again.
Again, without the window popping to the front.

OTOH, this does have _one_ disadvantage, in that it's impossible (without the
use of a 3rd party patch) to brind a window to the front unless its title bar
or resize icon can be seen.

The patch I use allows you (when pressing ALT) to drag a whole window. When
clicking the left mouse button, it brings it to the front of the stack. Using
the right bouse button, it leaves it in the stack (depth wise) but allows you
to change its position.

>

You reply int the newest window, close it, click on "Post" (or your local
equivalent!), and then you're back with fewer windows.

HTH

Just got the latest Next Gen in the mail today. Been noticing that
there has been no mention on VM news, you know...the haven for the Atari
Jihads that once worked for the now defunct Atari Corp. Have they
worked their majic the same way when at the now defunct Atari or still
not believe in marketing and being invisible?

Enquiring minds want to know...

sinclap...

however, this is rarely a problem, and even when it is theres often a convienient alternative (ie, reopen a directory, and it pops to the front)

I just did what you just described with my NT system here. I
opened clipcache which opened in front of my newsreader Agent.
The clipcache window is smaller than Agents so the editor window
for Agent is partially visible. I select a block of text in
clipcache and drag'n'drop it into agent's editor. Agent's editor
window didn't pop up to the front as you claimed it would.

Now *that* I cannot do. :)
It offers a minor advantage but not significantly so.

> OTOH, this does have _one_ disadvantage, in that it's impossible (without the

Now that shortcoming, I couldn't tolerate and I'd not give that
up for the advantage you stated previously.

Nice.

I do this in windows. I don't see the difference.

So...Apple should be like Atari? Release a new model every five years?

Much of the Mac users have had their macs between 4-10+ years before
upgrading to iMacs and G3's...

Don't piss off the Secret Service unless you want a Uzi shoved up your
you know what...-)

We don't want NZ to be left out when a U.S. Prez visits...Should be an
honor..

Actually Sean,
My reliable sources (the respected developers of Evergreen) have informed me
that really sinclap was busy snapping up every ICD Catbox produced to date, and
then had them buried in the desert, to help some wrinkly alien with penlight
batteries in his fingers contact his homeland....

Steve

The Nuon systems are being sold as DVD chipsets, as everyone knows.
This chipset will ship with new DVD players soon. One can surmise,
around or after the Xmas season.

In the meantime, there isn't much to advertise because the hardware
isn't out there yet.

So do you think it's worth telling Netscape about a rendering bug in the old
engine that's in NN 4.6? It only affects the windows version though.

Regards

First of all, nothing is off-topic in cola at least...;-) Also if any developers for the various platforms (look at the newsgroups...) are watching, people describing features they find useful - and more importantly - why they are useful will be very helpful to them when creating their own programs.

It rather like those useability tests, but without the expense and the subsequent marketing chest-beat.

It allows you to have the focus follow the mouse pointer rather than having to click-and-raise-to-focus. Like in X. The focus behavior of Windows really bugs me, and I guess it bugged some of MS's programmers too as they released a tool to fix it.

The only problem I've noticed is this new focus behavior confuses Netscape's Bookmarks.

Those same minds want to know why you don't have the courage to respond to my video editing posts here.. did you miss the reviews of FCP in MacAddict and Macworld? You know, the ones where they were smart enough to know that FCP is a product that competes with Premiere, NOT AVID turnkey systems.

Actually, they already know why you haven't responded.. they think you have actually come to the realization you don't know enough about the video market to respond. Maybe they're right..

It's too bad you don't have the honesty to admit it.. just another internet MacWacko coward..

We are creating a (free) massively multiplayer Internet game site and are interested in talking to people who have either:
1. already developed (or are near completion of) a massively multiplayer, shoot-em up kind of game;
2. developed/are near completion of/orare interested in developing (we have some cool ideas about the design of various games) classic, single-player oriented arcade games converted to multiplayer.

Thanks!
Frank Lyles

Running 95OSR2 with IE5, if I have the following showing.

```
---------------
|             |
|             |----
|      1      |   |
|             |   |
|             |   |
---------------   |
       |     2    |
       |          |
       ------------
```

I want to copy selected files piecemeal from window 1 to 2. I select the
files in 1, drag them to 2. Window 2 then pops up in front, meaning I've got
to do another action to get window 1 back in front.

In Risc OS

>
> > In addition, you can drag windows from _behind_ the stack, as though it

It suits the way I work better than the Windows way.

I've got 2 PCs and 1 RiscPC, and I find the Windows way of managing windows clunky compared to Risc OS

> > OTOH, this does have _one_ disadvantage, in that it's impossible (without

>

Most of the time, you find that because of the way Risc OS handles the windows it isn't a problem, because instead of having a huge MDI window in the way (say in the case of a graphics package), you can have all of the tool windows jammed against one edge of the screen, the artwork at the other, and still be able to see the desktop.

<snip>

> > > Oh? Then what happens?

>

The difference is that in Windows, all of the above are in the _same_ MDI "big" window.

Take for example Outlook Express that came with IE5. You've got the "groups" down the left hand side. The right hand side contains (at the top) the threads, and at the bottom, the message (this is the default setting that I kept because it irritated me less than the alternatives).

OK, you can have the current message in a separate window, but I personally find this a waste of space.

The setup I have ATM is that on the top LHS, I have the groups window. Over the top of this, I have the threads window - after all, if I'm reading a news group, I've no desire to see what other groups I'm subscribed to, or how many messages there are in them.

Slightly overlapping this again is the current message window. Similarly, I've got no particular wish to see the time/date that the message was posted, but I can still see the list of threads to the left of the message window.

And all of this time, because I've not got the MDI window in the way, I can still see my pretty desktop background/wallpaper.

I personally find the general Window handling of Risc OS to be an order of magnitude better than Windows.

Sure, Risc OS is not too hot under the bonnet, but ATM, the news/email software is IMO far better than anything I've seen on Windows. I've tried Turnpike, Eudora, Free Agent, Netscape Messenger and Outloook Express. If anyone has suggestions, as the Ferengi say, "I'm all ears!"

TBH, it's mainly the Messenger/Newsbase combination that's making me stick with Risc OS. It's free, powerful, has built in POP3, SMTP and NNTP servers, and is far neater than anything else I've seen.

Peter

Aha! Thanks for settling that. I feel FAR better that Tom Harker ripped me off with the end result being a lonely alien returned to the motherland. I wonder if that type of "donation" is tax-deductible?? Oh. What a minute. That train of thought could wrongly lead someone to infer my 2 "preordered" CatBoxes had actually been produced in the first place at some point! Just think of the 3 Dreamcast titles I could have picked up yesterday with the $150 I'm out.

Well, it won't do *exactly* what you want, but if you use the X-Mouse features that are included in Win98's TweakUI, you can set it so that the mouse gives focus without clicking, and you have the choice of whether or not the focusing raises the window to the front. Dropping files on an explorer window still acts like clicking on it, though, either way.

See, I actually much prefer Be's way, which doesn't require me to have two windows at all. I just select the files I want to copy, right-click, and slide through the destination tree to the location I want.

As a fallback, I like the Windows method where I select a bunch of files that I want to copy, select edit/copy, navigate to a destination, and choose paste.

In the end, of course, this is all a matter of personal preference. No matter what method you choose, someone will prefer another method better, regardless of how arcane the other method may seem to you.

>It suits the way I work better than the Windows way.

This is a very fair statement because you indicate that it suits the way you work better. Everyone works differently. I think that not realizing this is one reason why so many silly arguments about things which fall into the realm of 'preference' start. ;)

>Most of the time, you find that because of the way Risc OS handles the windows it isn't a problem, because instead of having a huge MDI window in the way (say in the case of a graphics package), you can have all of the tool windows jammed against one edge of the screen, the artwork at the other, and still be able to see the desktop.

Whether this happens or not in Windows is up to the designer, of course. While the scenario you describe above is more common and popular, I know of several Windows programs which operate by opening bunches of totally independent windows.

On the other hand, on Be (I keep mentioning Be only because this is still being crossposted to comp.sys.be.advocacy, among other groups), you can not only have bunches of windows, but you can slide their tabs over to whatever position you want on the top of the window so that you can make your windows be like cardfiles, if you like to use multiple overlapping windows. Also, the desbkar *and* the keyboard task switcher both work hierarchically, letting you choose the parent app first then drill down to a specific window, whether it's shown or hidden at the time (and with highlighting identifying which are currently shown and hidden). Myself, I don't use either of these features all that much because I much prefer to just sprawl myself in non-overlapping arrangements across many desktops, and switch between them. This works similar to Linux, except that the number of desktops is selectable by the user (is it in Linux? I don't know. I guess it would depend on your WM.).

"Usable" is such a vague term. I take it you mean "it's crap, but
it's all the poor Linux users have" ;)

I wrote a Tracker add-on for BeOS called XCV to do that in BeOS. It needs
some work, but it works pretty well. BeOS is so easy to program for.

Actually Perfect Screens has a toggleable feature for this but I have disabled it. I hate when my mouse accidentally brings a window in focus. I've gotten used to the concept that the mouse simply being in a particular location will not affect window focusing. My usual habit when I open a program like Agent here is to get the mouse pointer out of the way of the window since I operate Agent solely with the keyboard. I also get the mouse pointer out of the way of my editor window while typing. Suppose the mouse pointer accidentally falls on one of the background windows (this is very common for me because this doesn't normally concern me since it doesn't affect anything by default) it pops up uninvited.
Grrrr!

Anyway, different strokes.

That doesn't happen on my WinNT4 SP5 system with IE5 installed.
:)

Of course the cursor would hide itself as soon as you started typing in a

well designed interface. Mac OS does it. I'm sure some other OSes do as
well.

MS always misses the little touches when stealing ideas from people :-P

Actually my system is able to do this. Ever heard of M$ Intellipoint software???

> MS always misses the little touches when stealing ideas from people :-P

Tsk. Know thy enemy. The feature is already there in M$ Intellipoint.

I guess you did not see my response to your desparation...

Here is a snip of what Robert Morgan from Apple Recon thinks of the Avid
saga...

http://macweek.zdnet.com/1999/08/29/rfithurs.html

              Bulls and bears
              OK, back to other companies' responses to the G4 boxes. I
don't know if the muffled screams I'm hearing is one of them being
              mauled by that ravenous bear, or whether the bear's cub
just took a swipe at one of their backsides as they run away. We'll see.

              First and foremost, let's talk about Scooter. Scooter
sells a lot of boxes as servers, even though its strong-selling
workstations
              are in effect being used as servers in place of their
more-expensive brethren. And Scooter makes a lot of money from selling
              them. Doesn't matter as long as they sell. Yet once the MP
G4 boxes are announced and start shipping, Scooter might have the
              same problems that others are facing. Apple is raising the
bar as far as the price-performance ratio is concerned. If Apple ships
              just a dual G4 and not the quad-four, G4 X 4 boxes, the
price-performance ratio will start rivaling a lot of boxes that cost
              $40,000 or more. Especially given the extensibility of OS
X Server as well as the fact that it gets along with numerous Unix
              versions. Toss in compatibility with Oracle's
applications, and a lot of eyebrows will go up.

              Now, am I saying that Scooter is going to have serious
problems in the near term? Of course not. But all things considered,
              would you rather spend $10,000 on a box whose performance
is comparable to a $20,000 to $40,000 system, or would you
```

insist on spending that extra money?

Next up is Avid. Remember my bearish comments and sentiments on Avid when it announced its forced migration to NT over the objections of its Mac customers? In my estimation, Avid basically slit its own throat with that decision. Well, Avid is now saying that it will support Apple's G4 boxes. Several of The Heretical Monks -- myself included -- had a great belly laugh over it and came to the conclusion that it was probably too little too late. Avid could have had the digital video and audio markets handed to it on a silver platter, but it would have meant going software-only and jettisoning proprietary hardware solutions when it came to Mac offerings.

Neither Steve Jobs nor Apple wants to depend on only one vendor; when Avid balked, other solutions were developed as alternatives. (And I'm not only talking about Apple's homegrown Final Cut Pro.) Others will notice the opening and exploit it. Avid forgot that nature abhors a vacuum. And trying to say "Never mind," might be too little too late. Shorting Avid might have been prescient. We'll have to see.

On a related front, SGI is basically in the same boat. Some observers have characterized SGI's latest restructuring moves as a going-out-of-business strategy. I have a hard time arguing against that notion, even though the company is going to use MiPS in what you could call a "SGI Classic" and even if it uses Linux as the OS. About the only thing stopping a full-bore stampede away from SGI is that it was chosen as the development platform for Sony's PlayStation 2. My biggest problem with SGI: What if Apple ships a digital video and audio solution that rivals its offerings for price and performance? (Is it possible? Yes. Very possible. If not now, within the next year or so.)

What both Avid and SGI have in common is that their core businesses and markets of high-end graphics and video are moving very quickly toward digital video and audio -- a market that Apple is focusing on with hardware and software solutions developed in-house and by its third-party vendors. When it first surfaced, this new direction prompted many members of the Greek chorus to start moaning, groaning and wringing their hands, until I informed them that just because Apple is focusing on digital video and audio publishing doesn't mean the company is washing its hands of traditional publishers. After all, there's nothing stopping publishing pros from employing those solutions for traditional publishing. Most of the naysayers came in off the ledge when I pointed out that the G3 boxes they were currently using already had video capabilities, even if they didn't use it.

The key point here is that Apple's product offerings will soon surpass those of Avid and SGI when it comes to their price-performance ratio -- and possibly on performance alone. When Apple first launched Final Cut Pro back at April's National Association of Broadcasters gathering in Las Vegas, a lot of video pros said the software was good enough for about 80 percent of their work and that if future versions met the features of Avid's solutions and offerings, then that figure would rise to about 95 percent to 100 percent.

Why am I focusing on Avid and SGI while discussing the new G4 boxes? Because the majority of Mac users don't use them to design and test nuclear bombs. Most pro markets use them for "creative world"-type applications, including design and publishing, video, and audio.

But what really got me laughing is that critics of Apple and the Mac platform who had been insisting that the PowerPC chips weren't fast enough because they didn't go to 500 MHz are now downplaying the importance of speed. Is it because the G4 chips are not only in the 500-MHz range with the first boxes shipped and that those 500-MHz G4 chips are faster than a comparable Pentium III? Processor envy? Oh well. No matter. Price-performance is what will sway the target market for those G4 boxes, not whether they can sit there and tell others, "My processor is bigger and better than yours." It's not the car but the driver.

Stock rocket

I might as well end this column on a positive note. Apple has been hitting a lot of new 52-week highs of late, and it's perilously close to its all-time high. (Like within three points, give or take.) And even if others don't think the G4 boxes and the iBook pre-orders are a big deal, The Street seems to.

It's funny, but earlier this year when I opined that Apple's share price would head into uncharted territory, a lot of people thought I was crazy or had been out in the sun too long. Others listened to my reasoning and put their money on the table. Well, they haven't been disappointed to date, and there's still a heck of a lot of room to run for Apple. And given what I believe are Apple's future prospects, I wouldn't be concerned at all if its P/E ratio went up into the mid 30s. Why? For the same reasons I wasn't concerned about IBM's P/E ratios in '93 and '94. You're buying the future because of the turnaround, not the past. In some of cases, I'm not concerned about P/E ratios in determining whether a stock is overvalued or not. I wouldn't be concerned at all if Apple were sporting a P/E of 30-35 right now. (And yes, I know full well where that would place Apple's share price.)

If I'm going to afford all those new toys -- I meant tools! -- I guess I'd better get back to work making the money to buy them.

Have a great week and weekend.

By the way, is it just me or are others getting a hoot from Weird Al's "It's All About the Pentiums" song and video?

MacWEEK Contributing Editor Robert Morgan pulls the strings on behalf of himself and RFI. He welcomes comments at rfireport@pelagius.com. His Web site is Apple Recon for Investors (RFI).

... to ... type ... into ... the ... part ... of ... it ... that
... is ... exposed.

(Unless you are using the broken GUI that comes with Windows.)

The most common situation where I find this useful is when I want to
be able to type into the bottom of a shell window without having the
entire shell window on top - I only need to see the bottom few lines
of it. Meanwhile, on top there is perhaps a calculator or calender
or other such tool that I am reading something from, and I don't want
to to get hidden.

Only 1? :)

Seriously, it's not really worth talking to Netscape about the
'classic' rendering engine at all any more.

sinclap@my-deja.com wrote:

> I am sure these reviewers are video pro's or just tinkered with it for two hours?

As if it really matters. A professional wouldn't dare make the comparison, because it doesn't hold. A tinkerer wouldn't know enough to make the comparison.

> You will get your wish of a G4 card. I would buy a g4 machine if you can justify and afford it. The top two new G4's have been optomized for it...

Fine.. but it's pathetic to take away the upgrade path for loyal Apple customers.
There's no incentive to buy a new G4 if that won't be upgradeable..
who knows if Apple will pull this crap again? What about the ROM on the processor design that's being bandied about? Another Apple anti-upgrade move?
Stupid..

Plus, the first gen 400m G4's are 8100s in disguise.. stupid to rush them to market without the AGP slot, dual USB, etc (like holding on to Nubus for the 8100s). Only a fool would buy one.

Avid often is not much smarter than Apple with some of their decisions.. but Avid is owned in part by Intel, what do you expect? Also, Avid NEEDS a
6-slot machine for best performance.. and, of course, that's a model currently lacking in their line, next year's rumors notwithstanding. The mistakes were both Avid and Apple's.

> Here is Robert Morgan's take on Avid...
>

> http://macweek.zdnet.com/1999/08/29/rfithurs.html
> Next up is Avid. Remember my bearish comments and sentiments on Avid when it announced its forced migration to NT over the objections of its Mac customers? In my estimation, Avid basically slit its own throat with that decision. Well, Avid is now saying that it will support Apple's G4 boxes. Several of The Heretical Monks -- myself included -- had a great belly laugh over it and came to the conclusion that it was probably too little too late. Avid could have had the digital video and audio markets handed to it on a silver platter, but it would have meant going software-only and jettisoning proprietary hardware solutions when it came to Mac offerings.

RIDICULOUS. The pro world shoots in Beta SP mainly.. you NEED high quality m-jpg compression in order to digitize that format.. and that is a hardware solution.

> My biggest problem with SGI:
> What if Apple ships a digital video and audio solution that rivals its offerings for price and performance? (Is it possible? Yes. Very possible. If not now, within the next year or so.)

Sinclap, look at the above statement.. obviously, they are NOT shipping a comparable product. FCP is NOT comparable to SGI.. nor AVID.

> What both Avid and SGI have in common is that their core businesses and markets of high-end graphics and video are moving very quickly toward digital video and audio -- a market that Apple is focusing on with hardware and software solutions developed in-house and by its third-party vendors.

Now this guy seems to be an apple stooge. "Moving very quickly" toward dig video and audio? It's been there for five YEARS! This guy is as uninformed as you are.

> The key point here is that Apple's product offerings will soon surpass those of Avid and SGI when it comes to their price-performance ratio -- and possibly on performance alone. When Apple first launched Final Cut Pro back at April's National Association of Broadcasters gathering in Las Vegas, a lot of video pros said the software was good enough for about 80 percent of their work and that if future versions met the features of Avid's solutions and offerings, then that figure would rise to about 95 percent to 100 percent.

Now, he says something that makes sense.. NOTE: NOWHERE ABOVE DOES HE SAY THAT AVID IS "SCARED" OR THAT FCP IS READY TO DETHRONE AVID NOW. He is saying EXACTLY what I have said over and over.. maybe in a year or two.. and I have said FCP is a very good product for people who shoot a DV variant.

Of course, again, where the guy is missing the boat is that pros DON'T shoot on mini DV or a DV variant for the most part. Beta SP is still the media of choice.. and FCP is not designed for the SP user the way the AVID is.

I can't be sure of that yet. Do you have tweakUI installed, or is
some other utility on your system giving the mouse the ability to
change window focus by simply passing over the window.

I still use Forte' Agent for news. My main problem with Forte'
Agent is the user interface where I am unable to use multiple
separate windows. It makes things awkward. The cascading and
tiling options aren't useful unless you have a 21" screen.

I understand. Is it that I have to agree with you before you feel that I understand? But the fact that when I type, the window in which I'm typing has to be in focus is no big deal for most INCLUDING myself. In fact some may prefer if the window is at the front. Far more often than not, I desire to see the entire window that I'm typing in, so yes, I may have use for your feature in a few situations. Am I an unadvanced user for feeling this way?

> (Unless you are using the broken GUI that comes with Windows.)

It's not a broken GUI. It simply does things differently from your Risc OS GUI. Stay over your corner. I do not wish to get into any 'big dick' arguments over who's GUI is broken from who's isn't.

If you wish to discuss how the GUI's differ and therefore how the Risc OS GUI may benefit some with special needs and tastes and therefore *arguably* benefit and please a wider audience then let's do it.

I hear you. I wouldn't want the window coming to the top in that
situation either.

->Maybe the iMacs and G3's were sold out at the location...

  Can you read? I'm wondering because I clearly posted in the message that I
  played with an iMac and G3. How could I have done that if they were sold
  out? Eh?

->And the Falcon design is better?

  For me? In my humble opinion? Yep...

->Open Photoshop and FCP...Get back to me...Try that on a Falcon...

  Hehehehehe, transfer a small file (or two) from the iMacs to my
  computer via floppy, without spending any extra money to do it.
  Oh, sorry!-the iMacs don't use floppies... <grin>

Yup, it's the stuff that causes certain NT PC systems [1] to lock solid, until you unplug and replug the keyboard.

[1] Clash between the keyboard hardware and the intellipoint driver - both keyboard and mouse manufacturer have done nothing, we've screwed compatible replacement keyboards out of the PC manufacturer to sidestep the problem

It's the act of dropping the files onto the window that brings it to the
front, not moving the mouse over.

This is the kind of reason I don't like using Windows email/news clients.
I've downloaded Bat, but I'm too busy playing Hunted to do anything with it
:-)

Peter

My condolences. I however, have no such problem over here and
enjoy the aforementioned feature provided by intellipoint. Happy
lockups. :)

Try a DTP layout, fill the screen with the document, select a filer window
to have as a small intrusion over part of that large window, drag and drop
two different items into two different frames in the DTP.

The DTP window jumping to the front between each drag [1] is a pain in the
nether regions, however in RISC OS...

Yes flicking through open windows with ALT-TAB is useful but then if a
third party extension adds the feature why worry?

[1] Always assuming the Windows app and your release of Windows actually
does do true drag and drop.

OK, but I still don't get the behaviour that you mention on my
NT4 GUI here.

> This is the kind of reason I don't like using Windows email/news clients.

<smile>
Well, you are able to view messages in a preview pane or in it's
own window. You are also able to browse multiple e-mail folders
at the same time in separate windows. Mail composition is also
done in it's own window. It's quite a flexible app in this regard
and an excellent e-mail program overall. It does just what it
says, i.e., manage e-mail. It doesn't come bundled with html
support but instead provides the appropriate hooks for this with

it's approach to unrelated functionality being supported in a
similar fashion.

Indeed. The APEC summit is here soon. Already kiwis cannot walk in
certain parts
of my home town without feeling like the Secret Service is watching.
Bill Clinton
passes through soon and its costing Kiwi taxpayers NZD$35 million to
host this
trade summit. Thats more money than I think NZ will get out of any free
trade that
is agreed to here. Its a case of 'free trade' so long as 'we get a cut
from it too'

Somehow the message is all fucked-up...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

PS. Sorry to hear about the weather! Don't panic...we're expecting cold
gales and
heavy rain/snow overnight here to come through soon!! Another cold nite
at work
I can predict! bugger! ;^)

Hi there,

"Daniel L. Dreibelbis" wrote:
>
> CompUSA always has tons of people in when I visit - why the layoffs?

Because they probably couldn't sell gold for FREE. Always the majority
of sales in any retail outlet are made by a small percentage of the sales
team actually there...the rest are like limp, disused appendages...

Maybe the 'Apple Power Rep' made a big fuck-up, and the predicted sales of
his product went 'subterrafirma'?!...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> times ever, leaving the OS up both times. And one of those crashes was due
> to me deleting its preferences folder while it was running <g>.

Interesting how experiences vary. A friend of mine is a graphic artist and uses a Mac. It's his machine that I fiddle around to familiarise myself with the interface. During every single browsing session I have done on his machine using Netscape, I've experienced at least one hang, necessitating a power down and up. I'm amazed at how resilient he is with hangs. I sat and watched him create a pattern using Photoshop and using it as a layer to enhance an poster. After half an hour at doing this his

Mac hanged and he had to reboot and START OVER!!! I asked him how often that type of thing occurred and he said too often.

Intolerable!

I have since then advised him that he will not sell me on the Mac based on the Mac OS.

My brother and I were recently at the CompuUSA store in Lexington, KY. They did have a (small) Mac section, never found a sales rep, never even saw a customer there. Without exception, all customers were in the PC section while we were there. I know this probably isn't totally indicative of the Mac user base for that store but it sure didn't look good. It is also the very first time I got to play with an iMac and a G3. I absolutely loath the design of the cases on both. The G3's speed didn't seem to be too bad, but TBH, it didn't open windows any faster than my MiNT equipped, Nemesis powered Falcon.

Heh.

<grin>

[snippety snip]

How much memory is fitted in the Mac, and how much is configured for the
virtual memory system? I've found that Netscape can sometimes lock the
machine up when it's getting low on memory.

IME MacOS is more unreliable than RISC OS in low memory situations.

There is a software licensing limitation of opening more than

10 sockets on NT Workstation. :-) This may explain this one.

You hit the nail right on the head. He allocates most of his
memory to Photoshop, 64 out of 96MB. He did say that his problems
tend to arise in low memory situations. This is not a good thing
at all.

I'd say that OS/2 is a champion at being stable on low memory
systems with it's GUI running and all. It purrs on 32MB's system
with many processes running. The swapfile is under serious
pressure and the system slows down but it doesn'y hang.

Gobs and gobs of RAM and a recent Mac running Mac OS 8.6 is the way to go
for stability. This machine (a G3/400 w/256MB of RAM) has _never_ crashed
in Photoshop. Other programs that have been unstable on every other Mac
I've ever owned (like Strata Studio Pro) are also rock solid.

IE5 is solid. I stopped using Netscape after nearly 5 years because of it.

In Opera I have routinely 40-60 windows open. Gets a little
tricky then, but works for the mostpart. Talk about efficiency
here. ;)

>And Mozilla is due out before the end of the year. Unlike IE and Netscape
>it'll strictly adhere to standards.

Opera does that today already. And... if you know the test pages
on the Mozilla site, Opera loaded them all - simultaneously. For
a cute banner I once did, check the link from
http://www.argo-navis.com ;)

I gotta agree with this statement. I pushed Warp 3 well past the limits once on a 486 system with 8MB of RAM. It ran out of space to expand the swapper and popped up a warning notification telling me so. It asked me if I wanted to terminate the app that tried to allocate the memory or "ignore" the situation. If I picked "ignore," it blocked the app attempting to allocate memory until more memory was freed up by other applications. The process then continued running merrily along with no problems. That was pretty classy. ;-)

I try to keep it under 5. Not because Netscape can't deal with it, but
because I don't like screen clutter. I should try to see how much Netscape
can take one of these days.

> >And Mozilla is due out before the end of the year. Unlike IE and Netscape

The problem with that is it's not getting much use, so developing pages that will only display in Opera doesn't do much good. The Mozilla engine will be used in future versions of Communicator, and possibly in the AOL browser as well. That'll give it a very sizable chunk of the market.

This is the beauty of Opera and the way it operates out of a
single window. Even the 40-60 windows are a bit ridiculous.

One could say the same for win9x/NT. NT works very well with a
lot of resources. Win9x gets pretty stable as well with good
memory. Doesn't say much about efficient low memory management by
these OS's.

Ugh! no thanks.

If RISC OS ever starts doing this (my greatest fear with the new window
manager) I'm out of here.

MDI is evil, and would only make things worse here. Instead of having the entire screen to arrange things on, I'd only get part of it (or I wouldn't be able to keep things in the background visible). Sure, I'd be able to hide all the windows in one click, but in Mac OS I can do that without them all being contained in a parent window.

yep. and what is even more damaging, Apple is even admitting that FCP won't work with the G4 in their Tech Support pages. Let's see TiFKAS try to spin this one....

>

you're not the only one - did you see the web site where someone, after buying a B&W G3, re-did the entire thing in Black and Silver? Neat!

Now I wanna redo my Falcon in black, or at least try using a stone finish on it....

Hello there Richard Murray !
On 07-Sep-99   01:37:33, you wrote about Re: [MS-bashing] New collection of anti-Microsoft banners :

>> Hopefully, you are aware as to what to avoid to respect the choices of
>> other people.

> Ummm... There is a big difference between "designing" a website and
> browsing. [...]

Not for everyone.
Beginners usually "learn" how to build a Web site by looking at the source code of other people's pages. They then assemble pieces of HTML to make it look good with their own browser ("It works here. If it does not work for you, then your browser is wrong.")

Users of Outlook Express often send uselessly (garbage-) inflated mails just because they don't know it's a default "feature" of OE to send mails "layouted" with (misused) HTML, and that they can set it to normal text.

Let's not talk about all those .doc attachments sent without even knowing if the recipient is using Word as word processor.

... and so on

>> "Good because it isn't Microsoft" is an easy short-cut

> Not really. We should be good on our own merits, rather than "We're good
> because we aren't...".

> "Vegetarianism is good because we don't eat meat". It doesn't say much, does
> it?

Ok, I learn the lesson :-)

>> And you could even catch the attention of a few more people.

> Of just use font-drawn stuff on my website and wonder if people notice?

Banners are easier to manipulate with just standard HTML and CGI if you
want eg to display them at random or create a banner network.
(<URL:http://www.ping.be/amigaphil/SBill.pl> for a Perl example).

On the other hand, it becomes less easy if you wish to create a banner
dynamically from a given text (but tools exists to do that too).

When I hit a news site like slashdot, I'll open-in-new-window each link
that looks interesting then go through them one at a time.  I can
easily exceed 30 windows, if it is a busy day.

I can quite easily manage 20 Opera windows, while I'd probably
have to run looking for a multiple desktop simulator if I were to
try that with IE or Netscape. I've seen it done with about a
dozen IE windows and the taskbar was a mess and confusion. Make
sure, it's the only thing that you're doing at the time.

I wouldn't particularly push for this type of thing globally but
specifically for browsing it's a useful principle. It also works
very well for editors and word processors, not to have a new
window open for each document.

What if you browse in full-screen as I and many others do, then
you're already using all the screen estate. I'm not trying to
convert you but the method does have it's advantages.

With this method, I don't have to spend time arranging things
either because there's no arranging to be done. I can get on with
it. :)

By the way:

Right click the windows taskbar or hit winkey-D and you'll see
that you can minimize all windows in Windows as well. You can
also cascade, tile horizontally or vertically.

Most overestimate the Mac interface. I see no real advantages of
using it.

It can be done very rapidly with Opera as well, since the
keyboard shortcuts are beautifully thought out.

Shift+left mouse click on the URL opens the URL in a new window,
then you hit the '2' key which brings you back to the previous
window, select another link and open it in it's own window, hit
'2' again and so on ......

I love it.

Evidently you have ever used RISC OS's method of doing things...

No. I don't feel bad about having not done so.

If it's not a waste of your time, would you tell me what it's
like?

who is developing pages that _only_ display in Opera? no-one as far as I
can see.
that would be like developing pages that can only be seen by IE.
suicide.

I'd like to see Opera for the Atari, and have suggested that since they
are
developing a Linux version, that they keep one eye on BSD compatibility,
cause with that little extra effort, then can have a browser that will
work on
any Atari for almost no extra (programming) cost. BSD Unix -> MiNT
ken
the TAF guy

Fair enough...

> If it's not a waste of your time, would you tell me what it's
> like?

Sure...

All the desktop centres round the Filer (like windows explorer but FAR
nicer to use (and you have to use it to know that))

You have an icon bar at the bottom of the screen, about twice as high as
the windows one, on which hardware appears on the left and side (ie. drive
icons, printers, the ROM filesystem, CDROMfs's and pseudo-filesystems)
On the right hand side, there is a task manager, and a display manager
(RISCOS has always been able to change screenmode dynamically.)

You load applications by navigating through filer windows, and doubleclicking on the app. one can also "symlink" them on the "desktop" once loaded, applications typically place a small (36x36 pixel) icon on the icon bar (although they dont HAVE to) and sit there.

If you click on them, they open a new document window or their main window if they only have one window (ie. are not multi-document editors).

pressing menu on an iconbar icon for an application gives a standard menu, with info at the top, quit at the bottom, and anything else in between. pressing menu on a hardware device icon produces appropriate menus too (eg. floppy->format->Otherformats->DOS1.44M) (as you can see, menus are hierarchical and context sensitive.) "menu" is the middle mouse button. We dont have "menu bars" on windows ad pressin "menu" anywhere in the window produces a menu.

the right mouse button is used to "modify the actions of the left one eg. left click on close = close window. right click = close and open parent.

Yes he has, because RISC OS does it the same way as IE. That is one
window per document.

Yes, but RISC OS has much much MUCH better ways of managing the windows.

The only things that are MUCH better about RISC OS are being able to push windows to the back, and no auto-fronting. Everything else is just trivial niceties. And it doesn't even provide you with a way of listing the windows so you can jump straight to the one you want without having to hunt for it (unless you get some 3rd party add-on). RISC OS really isn't special in terms of window management.

Opera displays pages according to the W3C standard. Period. So if
they look good in Opera, I should expect them to look good in IE
and NS, too, so I don't have to go through the nightmare of
checking with either of them for consistency. But as NS/IE don't
stick to the standards or have a lousy interpretation of it (like
NS re: CSS), this is unfortunately only a dream.

My favourite (and incidentally my invention, too) is Shift-Ctrl-Click which opens a browser window (inside the MDI) in the background. In practice - and now you SDI evangelists listen carefully ;) - this translates into this:

I go to a search engine or link listing and just S-C-click until I no longer want more links opened. Now while I S-C-click, my window with the search engine results or links ALWAYS remains on top, and while I skim the listing for more interesting links, the others open in the background just as one would expect this from an efficient browser.

I claim to be at least 3-4, sometimes even 8-10 times faster, IOW I get my work done much quicker with Opera than with any other browser. And trust me, I DO browse a lot, mainly for my new site at http://www.inspiredmind.com

But this is getting off-topic now.

Cheers,

Helmar

The main difference is that it is /far/ easier to manage window positions on your desktop. For one thing windows don't automatically come to the front when you click on them, so you can be typing something into one window, whilst monitoring what's going on in another.

Programs often use multiple windows without it being a problem. My mail/newsreader, for example; when first loaded, you get a small window which lists your mailboxes. If you double-click on one, a new window opens which contains the messages inside it. If you double-click on a message, it is opened in another window. If you click on 'reply', another window is opened. You'd think all this would make the desktop very cluttered, but it doesn't.

I've never quite managed to work out why people discount third party addons.
OK, so they're not written by the OS author, but that doesn't necessarily
mean that they're any less reliable or integrated. All my third party addons
together come to less than 1MB, which is still a fraction of the size of
Windows.

Finally I hear something advantageous. :) How often does someone
wish to type something and they can't see what they're doing. It
sounds more geeky than anything else.

Oh? Then what happens?

Don't leave us in suspense. What third party addons do you use? I
believe in them as well so I'm wondering.

Quite often actually. I do this all the time. It's not typing blind, but merely the window you're typing in is underneath another window (say an HTML source code window or graphics editor window) but with the actual text part visible - ie the windows are overlapping.

I often have a paintshop type image on the screen and can obscure the image part with another window that I might be copying text out of to enter onto the bottom of the image. I thus want to type on the bottom window without affecting my stack of windows on top.

All sorts. I use !OpenFiles to keep tabs on which files are open by the system (and close specific ones if I wish), WimpBar to give me drop down menus along the top of the screen, LineEditor module to give me a Linux style command history from the CLI prompt, 3DPatch to give a 3D feel to dialogue windows, LongFiles to give long filenames on pre-RISC OS 4 machines, CoolSwtch to switch between application windows (bit like CTRL TAB on Windoze), DirMenu to give a filer tree on the title bar of filer windows - to name a few. These in total only add a couple of hundred K to my system memory usage.

```

Hmmm. I see. I consider myself a geek by my standards so I'm glad
that you were't offended by the use of the term. The beauty of
windows is that there may just be some utility around to give you
this ability. One OS will not have all the advantages and quirks
to satisfy all users.

Good for you that you happen to have an OS using that has this
useful feature for you out-of-the-box. :)

Is this windows that you are speaking about or RiscOS?

For my NT system, I use Perfect Screens to give me multiple desktop functionality, Clipcache to improve my clipboard capabilities, Getright to improve my ftp and downloading capabilities, rascal pro to better monitor my internet connections and keep them active to avoid unwanted disconnections, Salamander to improve on explorer, BeDeamon as a task launcher and many other small utilities that I use as needed. :)

I'm only able to get Apprunner working, but it may have something to
do with me not having glibc 2.1 (They've dropped support for 2.0).

I've heard good things about the Win32 builds, they even have Java up
and running reasonably well (So it's already better than NS 4 ;)).

Right, this is all good. In theory. I've seen pages that render correctly
in iCab (which is also rather standards compliant), but don't render
correctly in IE.

A new collection of "Anti-Microsoft" Web banners is available at

<URL:http://www.ping.be/amigaphil/pic/SBull.html>

Those are based on a "Microsoft FREE" seal (16 colors, Netscape palette used)

Other collections have been updated too :

- More cream pies for Bill Gates
  <URL:http://www.ping.be/amigaphil/pic/SBill.html>

- Pie Steve Ballmer
  <URL:http://www.ping.be/amigaphil/pic/SBall.html>

Last: As an extra, a set of "Microsoft FREE" stamps specially designed for Web pages (monochrome, transparent background) is available as part of the archive downloadable from the above pages, or from:

<URL:http://www.ping.be/amigaphil/Anti-Microsoft.html>

(see bottom right corner of the page)

Yuk !?! :-(

Do you think the choosen slogan are bad ?
Would you like to suggest better ones ?
Would you like to suggest your own banners ?

Or do you think the whole idea is a waste of time ?

Hello there Tim Mayer !
On 26-Ao�t-99  04:57:37, you wrote about Re: [MS-bashing] New collection of
```

anti-Microsoft banners :

> What a waste of WEB space -- these are really dumb.

Re-yuk !?! :-((Are they really THAT bad ?)

As I said in a previous reply, I would be please to hear suggestions
for better ones. If you are not interested at all, please forget it
and let start wasting our time on something else ;-)

Looking at the site, I didn't think there were _intended_ to be funny.

Do you really think that everybody who advocates open standards must be
making a joke at Microsoft's expense?

--
When a clever man was stupid, he was stupid in a way a man who was
stupid all the time could never hope to match, for the clever man's
stupidity, drawing as it did on so much more knowledge, had a breadth
and depth to it the run-of-the-mill fool found impossible to duplicate.

I totally understand where people are coming from on this issue, and I notice that this is cross-posted to a wide variety of newsgroups addressing different OS communities, but I honestly think that it is the wrong track to take, both for those of us who are relatively new on the scene (I'm posting from the BeOS group) and those in the more established communities.

As soon as you define yourself solely in terms of another, I think you lose a lot. I've never been a fan of political campaigns where the whole push for a candidate centers around what's bad about the other candidate, and similarly, I always wince when somebody asks what should interest them about BeOS and people respond saying, "Well, it's not made by Microsoft!" If a product cannot stand on its own merits, then it's not much of a product, and I'm sure none of us would like to think that we are using our chosen platforms for that reason and that reason alone.

Here's an exercise we should all do :

Step 1 : Sit back and think only positive thoughts about your computer. Think of the thinks you like to *do* with it. Think about when you are happiest and what you're using your computer to do when that occurs.

Step 2 : Write a short essay to your favourite advocacy group explaining what you do with your computer that makes you happy. Do not use the word Microsoft, and do not compare your platform to any other platform. When composing this essay, try to express yourself using only positive language. Do not mention what you're glad your computer does *not* do. Mention only what you're glad it *does* do.

Step 3 : Lie back in bed before going to sleep, and work through this scenario -- Microsoft has disappeared from the world, along with all of their products. (This is not a fantasy of mine, just part of the setup.) Think about your platform in such a world. What defines it? What makes it unique? What drives its users and breathes life into it? What sustains developers' passion?

These are the kinds of issues and thoughts we should concentrate on if we want to succeed, or even if we want to have a healthy, happy computing experience. Spending your life hating Microsoft is a waste of energy which could be used to forward the positive cause of your platform instead. In the words of Henry Rollins, "You're giving them too much of yourself." Hatred is the path to the dark side, young jedi. Use your powers for good, not evil.

This article is so full of technical inaccuracies and propaganda that I was almost to the point of screaming at my monitor when I was done reading it.

I'm referring to the article located at http://www.osopinion.com/Opinions/JohnPenner/JohnPenner2.html, titled "Why I Macintosh? A Year Later" [sic]. I'll start off quoting his words, and then presenting the facts, something that Mr. Penner doesn't seem to know the meaning of. Misunderstanding is acceptable, but propaganda, twisting of the facts, and out-and-out lying is intolerable. I'll quote various bits of the article, all in context.

"When buying a computer, many people just buy what is most popular. If you're not of the opinion that McDonalds is the best food in the world because a lot of people eat there, then you may understand the non-lemming-like concept that a system must justify itself on its merits, and not just by a popularity contest."

This analogy is no more valid then the Lexus(Mac) Yugo(PC) analogy. Analogies like this are worthless due to the author's lack of providing facts to back it up. Empty analogies are a common ploy by Mac users to try to present something as fact, when it's really a not-so-well hidden opinion.

"After using all three systems extensively, I can decidedly say that the Mac allows me to get my work done faster, and lets me do so in a highly customizable environment that is also elegantly implemented and a joy to use. There is a reason Mac users are so fiercely loyal to their platform, and it lies in an appreciation for good operating system design that is oriented towards a good end-user experience."

No, it lies in fanatical users [like yourself] who are obsessed with thinking that they're special just because they use a Mac. You may very well be productive on the Mac, but most are quite productive on Windows, thank you very much. Try speaking for yourself next time.

"My current machine is now an iMac. This "consumer" machine packs a lot of power in a simple form-factor that really has been well thought-out. After owning this iMac for about a year (since last aug.15), I have absolutely no regrets -- I am so happy with my decision to have got it, that I'm replacing a silicon graphics r5000 workstation (I've been running irix Unix for the last four years on it) with one."

The mind boggles.

"This will bring me a significant speed boost (MIPS r5000 200Mhz -> g3 333Mhz), and broaden the amount of software available to me significantly. I have over 300 pieces of application software for the Mac, but I only use a fraction of it regularly. Although I would consider myself a power user, I run at most 5-10 core applications per day. To give you an idea of the applications that I use routinely on the Macintosh, I list them here:

- Netscape 4.5 - for web and mail; the first and the best."

Like I said, obsessed with obsolete technology. IE 4.5 for Macintosh is a better browser (even the rabid Anti-MS people at Mactoday admit this), and IE 5 Mac will be great. But Netscape? No thanks.

<Large snip>

"As I make my living organizing project directories, and writing documentation, I spend a lot of my time filing things. I like access to the filesystem to be a clear and direct one. The Windows system "hides" the real goings-on of what is happening to your filesystem with little icons on your desktop. The Mac actually gets you closer to the filesystem so that it doesn't need "wizards" to simplify it for you, because the filestructure is logical and clear down to the system level."

Filesystem wizards?! Whaaaa? Last I checked, I can access all my files through My Computer.

"When you see an icon on a Mac desktop, you know you're actually looking at a file whose directory path is: hard-disk/desktop folder/my file. With Windows, this is an illusion created by a shortcut somewhere on your hard disk."

The Desktop is actually a folder in C:\Windows\Desktop. So? Newbies won't even notice, and power users couldn't care less. In fact, the only people bitching about it seem to be people like you: misinformed Mac users.

"Likewise, on the Mac, you have an "Apple Menu Items" subdirectory. You put a file in there, and it shows up in the Apple menu. What you see in the apple menu (Microsoft ripped this off with the "start" menu several years later), is actually a listing of files in that directory. It is fundamentally elegant. With the start menu, your system is hiding more complex goings on because it isn't directly tied to something like what is actually in a file-directory."

"Complex goings on"? They're shortcuts to the actual files in their respective program folder. This is neither complex or hard to understand.

"This creates a disparity between what the user does and what actually goes on in the system, giving the user a false sense of simplicity when the underlying mechanism is actually too complex for most users to figure out, thus requiring "wizards" to do basic housekeeping."

I've got a question: Who cares as long as it works? Again, this isn't complex... and what the HELL do wizards have to do with any of this? Not a DAMN thing.

"Another thing I like about the Macintosh is that I don't need an "uninstall". It is an absurd notion on a Mac, because all the stuff the program needs is neatly filed into the application itself through user-customizable "resources". This lets me change menu keyboard shortcuts, dialogue texts, and any resource an application might use. If I drag over an application from one disk to another, I have all the resources RIGHT THERE, and they can't get separated or lost from the program like with Windows (because you'd probably be missing a few critical DLL type files)."

This is a non-issue. Install/Uninstall wizards let you choose how you want the program set up, and with what options. Uninstall is also a simplified way of quickly removing a program. And I'd bet $20 that you haven't the faintest idea what a DLL is, let alone having a DLL problem.

"With the Mac, I copy exactly ONE file to a disk, move it to another directory on a different computer, click it, and it still runs every time. This is not possible with Windows, because you have all these niggly "DLL" files that are separated into different files all over the hard disk, and to track them down for all your applications is so complex that they had to invent an "uninstaller" to find and get rid of them all."

This has been addressed in another post. DLLs are not "separated all over the hard disk", they all have assigned folders and special places.

"This is simply because the system was badly designed in the first place. Because of resources, all the cryptic files that belong to applications are rendered obsolete, and also made more standardized. It also means that Macs don't need ".txt" or ".doc" on the end of filenames just to figure out what they are."

Again... So? And it isn't cryptic, as any regular user can tell you can "txt" means text, and "doc" means document. Sheesh.

"If you take these almighty important letters off the end of your filename in windows, the system is screwed, and can't even figure out what kind of file it is."

First off, you can't edit the extension "just like that", so your entire argument is extremely flawed.

"Is it a tiff image? A Microsoft word document or an html file? The system just can't live without that little extension stuck on the end of it. All these little filename extensions are kept track of in a "registry file".

Does anyone really care? Not me, nor anyone I know...

"The archaic disk-centric filenaming conventions of C: and A: and legacy dos

8.3 filenaming conventions will still plague Windows users for years to come. It is illogical and inefficient to kludge a disk-centric C:\ filesystem to adapt to a networked filesystem. Microsoft has had to make their whole OS stand on its head in order to make it work properly in a networked environment because C:\ is conceived of from a disk-centric point of view. Furthermore, Microsoft has had long filenames since Windows 95, but they still have convoluted filenames like: win.ini, autoexec.bat, and nddend.dll, and they always will."

Once more: Who gives a rats ass? So Microsoft didn't use 61 letters for naming those files... does this in any shape or form prevent me from naming my files longer then eight letters? The answer is no.

"Something you just don't ever have to worry about with a Mac. I have better things to do with my time."

Yes, like spouting off about "problems" that only Mac users bitch and moan about.

"One of the fundamental aspects of GUI design presented to a user is how they handle menus. On windows, you have a separate menubar in every single application window that you're running. This is a kludge. Instead of having five menubars in five windows The Mac simplifies this by consolidating them into a single menubar along the top of the screen. This makes it faster and easier to hit (no mouse overshoot to slow things down), eliminates clutter in the interface, and reduces ambiguity, as it changes context intelligently to eliminate sources of user error. (See Why Single Menubar? located at: <URLSnipped>"

This all depends on a user's preference. Although, most find the Mac's way of consolidating all the menus into one is restrictive and counter-productive.

"A few notes on the iMac hardware.

The iMac is really the next step in the evolution of computer hardware. Before, I had one plug for my keyboard, another plug for my mouse, a third plug for my printer, and a fourth plug for my zip drive and scanner--all of them incompatible and different types of connectors. If you value simplicity, you will appreciate the fact that all four of these connectors have been eliminated and replaced with a single plug. I now have: a mouse, keyboard, scanner, videocam, zip drive, and printer all hooked up to one standard interface. This makes things simple."

Welcome to the wonderful world of USB, brought to you by Microsoft, Compaq, and Intel.

" They have gotten rid of the clutter of ports on the back and replaced it with one universal peripheral plug.

It makes too much sense, but some people still prefer to have a bunch of incompatible ports and fiddle with IRQs and bulky 25pin connectors for their printer."

IRQs have less to do with peripherals (like printers), then motorcycles have to do with rock climbing. More astounding ignorance.

"On PCs, these legacy ports will take several years to phase out. On the Mac it's a done deal. Mac users are already over that hump and live in a world where they don't have to worry about it. It already just works."

Just because a new technology comes along doesn't mean that all previous technologies no longer work. Sure, I've got two USB ports on my computer, but does that mean I _have_ to buy USB peripherals? Well, if I had an iMac, the answer would be yes. Sorry, but my current devices work just fine. I have no need to radically switch to USB.

"Furthermore fast (100baseT) networking is built into every Mac. This is an option on most PCs."

...And you can add a NIC to any PC for $25. And don't think that you aren't paying for that NIC in that beloved iMac of yours.

"The iMac moves away from the backward thinking disk-centric model of a computer to a network-centric model."

Sorry, that's incorrect. Removing a floppy drive from a computer doesn't make it a Network Computer.

"In five years it will be clearly evident how important it has been to include a fast network connection as standard equipment on every machine. One standard port for local peripherals, and one standard port to hook into the network. The engineers at Apple have made everything as simple as possible, but no simpler. This is the definition of elegant engineering."

Definition my ass. Apple was one of the last PC makers to adopt USB, and the iMac sure as sh*t ain't a NIC.

"The iMac's hardware design simplifies the peripheral and hardware I/O with a modern network-centric design, and provides a plug-and-play that works."

As opposed to Windows PNP that doesn't? Sorry, that'd be wrong, too.

"For those that need more performance, add a fast firewire bus as standard to the motherboard if you get a G3 pro tower. This provides a superb interface for high-bandwidth high-storage applications like video editing."

IEEE 1394 isn't Mac only. Sorry to burst your bubble.

<Picture of G3 processor next to Pentium II>

"The iMac contains a G3 processor. If you actually poke your nose into the box to look at the "engine" -- you will be struck immediately by the size differential between an Intel Pentium and a G3 chip. The Pentium is almost quadruple the size of the g3 to do the same function. How is it that that a g3 chip can process faster than a Pentium chip, be a fourth the size, and run cooler? Well, it has to do with better design."

First off, the Pentium in that picture has a oversized case to house the heat sink. If you'd take a look at the Pentium without the case on, you'd see that the actual processor is the same size as the G3. Even if the actual chip was bigger, who really cares? How does it effect me, as an end user?

"The Pentium chip uses a "complex" instruction set (cisc) -- it contains a lot of legacy work-arounds to accommodate archaic instructions going back to the first 8088 microprocessor used in the first PC in 1982."

Another fallacy, which shows that you know less about modern processors then Andy Rooney.

"This was a 16bit architecture (think lanes in a highway). Now the Motorola series of processors started out life with a simplified 32bit-instruction set (RISC). This allowed you to get more horsepower out of the chip with fewer parts. Less parts means smaller size, and uses less power. When Intel wanted to go to the Pentium, in order to remain compatible, they had to keep the old 16bit stuff in there even for newer generations of chips. This means they need more parts just to make a Pentium work around the old legacy stuff than Motorola needs to make their whole g3 chip. Because it has a less convoluted architecture to move data around in, a 250Mhz RISC chip does the same amount of work as a 400Mhz cisc chip, and is smaller and produces less heat to boot."

I really, really feel sorry for you if you truly believe that to be the truth. I'm not going to bother going into detail on this one. It's been debunked countless times by myself and hundreds others, but some ignoramuses like yourself fail to see the simple facts.

And they say public school is a success.

"This is why manufacturers have so much trouble making Pentium notebooks as fast as desktop machines. The Pentiums need more power and produce more heat than the RISC chips. That is also why you cannot buy a Pentium notebook that is as fast as apple's g3 notebook at any price."

Are you Steve Jobs? Your RDF looks an awful lot like his...

"Last, but not least. The Mac doesn't have a y2k problem."

Yep, you're Steve Jobs. No one else on earth could possibly be such a moron.
It's people like you I like to smack in the face with a giant, smelly, fish
called reality.

>

Are you kidding. Your telling me that "Safe Hex" is not suppose to be funny? I understand the joke, but just did not find it humorous. The pictures of Gates with pie on his face I found to be a little distasteful, but were an obvious attempt at humor.

Actually, I must correct myself here, I did find a few of them to be funny. Especially the "Who does he want to own today", "Where does he want to go today" and "Sorry Bill, I choose where I want to go" as well as a few others.

>
> Do you really think that everybody who advocates open standards must be
> making a joke at Microsoft's expense?
>

Although some are specifically supporting open standards, many of them are simply bashing.

Parallax Inc. and Dr. Dobb's Journal proudly present...

The Vintage Computer Festival 3.0
October 2nd & 3rd
Santa Clara Convention Center
Santa Clara, California
www.vintage.org

For the third year in a row, the Vintage Computer Festival is back to thrill and amaze you with the history of one of the greatest inventions in all of mankind, the computer!

The Vintage Computer Festival is for YOU! We don't care which computer you think is the best. We don't care what machine you grew up with, or first fell in love with, or still use today. The VCF is a celebration of all computers and their history! Come share the joy of computing!!!

This year:

- More great speakers!
- More great exhibits!
- More great vendors with Cool Stuff to sell!
- More fun games and contests, including the Nerd Trivia Challenge!
- Tour The Computer Museum History Center!
- And of course, FREE STUFF!!

In short, plenty of stuff to indulge all your SENSES:

HEAR the speakers! SEE vintage computers! TOUCH them too!
SMELL their electronics! But please don't TASTE them!

> "The mission of the Vintage Computer Festival is to promote the preservation of 'obsolete' computers by allowing attendees to experience the technologies, stories and people that embody the remarkable tale of the computer revolution."

If you haven't yet experienced the VCF, DON'T MISS THIS ONE!!!

Register Early and $AVE!

Register by September 15 and pay only $20 per person. That includes access to the entire event all weekend, including the speakers, the exhibit and the flea market. Kids 17 and under are admitted free, and as always, parking is free too!

To pre-register, send a check or money order to:

Vintage Computer Festival
4275 Rosewood Drive PMB#29-161
Pleasanton, California 94588

For ultimate convenience, please visit the VCF website for more information as well as a handy registration form ready to print.

http://www.vintage.org/vcf/register.htm

The Speakers

Horst Zuse

Horst, the eldest son of early digital computer pioneer Konrad Zuse, will be giving a lecture on his late father's machines and will focus on the computer businesses that Konrad later founded to market his ideas.

Jon Titus

Who can forget one of the earliest of kit microcomputers, the Mark-8? Jon designed the Mark-8 around Intel's 8008 microprocessor and wrote the construction article that appeared in the July 1974 issue of Radio Electronics--a milestone in microcomputer history.

Todd Fischer

Todd bought the assets of IMSAI after their bankruptcy and continued to manufacture and sell IMSAI products under the Fischer-Frietas Corporation. Todd consulted with MGM for the movie _War Games_ and, as a treat, will be bringing along for show and tell the actual IMSAI 8080 computer that co-starred in the film.

Michael Wise

Mike contends that his Sphere Computer circa 1975 is in fact the first integrated "Personal Computer". Some people think he has a valid claim to that title. Come hear his story and decide for yourself.

Ed Kramer

Ed has been creating computer graphics since the days when it was done using mainly analog video devices. Today he's a Sequence Supervisor for Industrial Light & Magic doing computer generated graphics and special effects for such films as "Deep Impact", "The Mummy" and "Star Wars: The Phantom Menace".

Jim Willing

Our admired and beloved VCF Celebrity, Jim will wax philosophic on various themes of stupendous relevance. This year, Jim will help the aspiring vintage computer collector restore their machines to operating condition with "Debugging for Dummies", and will also give you tips to help you revive ancient copies of your favorite computer games in "Dead Media Society".

Liza Loop

Liza heads up the LO*OP Center, a non-profit organization dedicated to improving education through innovative thinking. Liza introduced the first Apple into public schools in 1976 (in fact the first Apple 1, given to her by Steve Wozniak) and the world has never been the same since. Liza will be bringing along the Apple 1 and other historic machines for show and tell.

Eugene Kim

Eugene recently left Dr. Dobb's Journal as Senior Technical Editor to start his own consulting firm. He'll be giving a lecture on the history of free software, a very relevant topic considering the free-software movement is in full force in today's computing arena as evidenced by the escalating adoption of GNU/Linux.

Roger Sinasohn

Roger is an avid collector of early portable computers and will be giving a talk on the history of the Kyocera 85, a.k.a. the Tandy Model 100, a.k.a. the Olivetti M10, a.k.a. the NEC PC-8201A.

Doug Salot

Doug's research has uncovered what he believes to be the first "personal computer". Forget the Apple][, the Altair or even the Alto. Doug's pick as first PC goes all the way back to the 1950's. Designed by Edmund Berkeley, an unsung hero of computer history, Doug intends to win Berkeley the prominance and praise that he feels is much deserved by this virtually unknown computer visionary.

Plus!

Workshops by Parallax on their amazing little BASIC Stamp. Get a preview of this cool little device by visiting their website at http://www.parallaxinc.com.

For complete speaker information and schedules, point your favorite web page viewing software at http://www.vintage.org/vcf/speakers.htm.

The Vintage Computer Faire and Exhibition

This year, the Vintage Computer Festival exhibit will feature the exhibits of individual collectors, all vying to win first, second or third place in eleven categories, plus the coveted "Best of Show" award. The winner of the "Best of Show" ribbon will also win fabulous prizes.

This year, we want YOU to exhibit the pride of your collection. What better way to demonstrate your enthusiasm for your hobby than to be an exhibitor at the Vintage Computer Festival.

Exhibitor information can be found on the Vintage Computer Festival website (http://www.vintage.org/vcf/exhibit.htm).

The Vintage Computer Flea Market

Every year the best deals on vintage computer items can be found at the Vintage Computer Flea Market. Here are only a few of the amazing items sold at last year's flea market:

* Apple 1 (no, we're NOT kidding!)
* SWTPc 6800
* A rare computer by "the digital group"
* Morrow Decision 1 (S-100)
* California Computer Systems (S-100)
* Apple Lisa 2
* And much, much more!!

If you've got old computer stuff that you'd like to sell, there's no better place than the Vintage Computer Flea Market at the Vintage Computer Festival. Please visit our website for rates and regulations (http://www.vintage.org/vcf/vendor.htm).

The Nerd Trivia Challenge!

Hey trivia fans! Think you got what it takes to survive the Nerd Trivia Challenge? If you qualify, you'll be pitted against two other players in a battle to determine who is the undisputed master of computer history trivia. Answer the most questions correctly and you could walk away with $50 in cash plus some other nifty prizes.

Lightweights need not apply, this contest is geared towards the serious computer history enthusiast. For contest rules please visit http://www.vintage.org/vcf/ntc.htm.

Tour The Computer Museum History Center!

The Computer Museum History Center boasts the largest collection of historic computer artifacts in the world. Their collection includes rare, one-of-a-kind computers and artifacts that date back to the early part of the century and beyond.

A tour of the History Center's "Visible Storage" warehouse will be organized on Sunday, October 3. Tickets are limited and so advanced registration is recommended.

FYI: The History Center is on the move, and is thrilled to announce plans to build a permanent museum to be dedicated by 2007. You can help the History Center achieve its goal by becoming a member. Information about becoming a member of the History Center can be found at http://www.computer-history.org.

Meet Fellow Computer Collectors!

The VCF is the premier gathering for collectors of vintage computers. What better way to enjoy your hobby than by meeting other like-minded individuals to share stories and information about your computer collection. Register in advance by September 15 and save $$$! Visit http://www.vintage.org/vcf/register.htm for details.

Visit our Sponsors!

Without our sponsors, the Vintage Computer Festival could not be a reality. It is our wonderful sponsors that enabled us to bring you the Vintage Computer Festival year after year. Demonstrate your appreciation by visiting them on the web:

Parallax, Inc.
http://www.parallaxinc.com

Parallax manufactures the BASIC Stamp, a versatile microcontroller with a built-in BASIC language that is suitable for most any electronics and computer hobbyist project.

Dr. Dobb's Journal
http://www.ddj.com

Dr. Dobb's Journal is the oldest continually running microcomputer journal, in existence since 1975. It features monthly articles and columns geared towards the computer programming professional.

>"When buying a computer, many people just buy what is most popular. If

>you're not of the opinion that McDonalds is the best food in the world
>because a lot of people eat there, then you may understand the
>non-lemming-like concept that a system must justify itself on its merits,
>and not just by a popularity contest."
>
>This analogy is no more valid then the Lexus(Mac) Yugo(PC) analogy.
>Analogies like this are worthless due to the author's lack of providing
>facts to back it up. Empty analogies are a common ploy by Mac users to try
>to present something as fact, when it's really a not-so-well hidden
opinion.

The analogy *is* valid. Judge everything based upon its merits, not upon its
popularity, is what he's saying. That seems pretty valid to me.

>"After using all three systems extensively, I can decidedly say that the
Mac
>allows me to get my work done faster, and lets me do so in a highly
>customizable environment that is also elegantly implemented and a joy to
>use. There is a reason Mac users are so fiercely loyal to their platform,
>and it lies in an appreciation for good operating system design that is
>oriented towards a good end-user experience."
>
>No, it lies in fanatical users [like yourself] who are obsessed with
>thinking that they're special just because they use a Mac. You may very
well
>be productive on the Mac, but most are quite productive on Windows, thank
>you very much. Try speaking for yourself next time.

He's not saying you're not productive. He's saying /he/ is more productive
on a Mac. He *is* speaking for himself.

>"My current machine is now an iMac. This "consumer" machine packs a lot of
>power in a simple form-factor that really has been well thought-out. After
>owning this iMac for about a year (since last aug.15), I have absolutely no
>regrets -- I am so happy with my decision to have got it, that I'm
replacing
>a silicon graphics r5000 workstation (I've been running irix Unix for the
>last four years on it) with one."
>
>The mind boggles.
>
>
>"This will bring me a significant speed boost (MIPS r5000 200Mhz -> g3
>333Mhz), and broaden the amount of software available to me significantly.
I
>have over 300 pieces of application software for the Mac, but I only use a
>fraction of it regularly. Although I would consider myself a power user, I
>run at most 5-10 core applications per day. To give you an idea of the
>applications that I use routinely on the Macintosh, I list them here:
>
>- Netscape 4.5 - for web and mail; the first and the best."

>
>Like I said, obsessed with obsolete technology. IE 4.5 for Macintosh is a
>better browser (even the rabid Anti-MS people at Mactoday admit this), and
>IE 5 Mac will be great. But Netscape? No thanks.

Browser choice is largely a matter of personal preference. Both browsers do
what they're supposed to quite sufficiently.

><Large snip>
>
>"As I make my living organizing project directories, and writing
>documentation, I spend a lot of my time filing things. I like access to the
>filesystem to be a clear and direct one. The Windows system "hides" the
real
>goings-on of what is happening to your filesystem with little icons on your
>desktop. The Mac actually gets you closer to the filesystem so that it
>doesn't need "wizards" to simplify it for you, because the filestructure is
>logical and clear down to the system level."
>
>Filesystem wizards?! Whaaaa? Last I checked, I can access all my files
>through My Computer.
>
>
>"When you see an icon on a Mac desktop, you know you're actually looking at
>a file whose directory path is: hard-disk/desktop folder/my file. With
>Windows, this is an illusion created by a shortcut somewhere on your hard
>disk."
>
>The Desktop is actually a folder in C:\Windows\Desktop. So? Newbies won't
>even notice, and power users couldn't care less. In fact, the only people
>bitching about it seem to be people like you: misinformed Mac users.
>
>
>"Likewise, on the Mac, you have an "Apple Menu Items" subdirectory. You put
>a file in there, and it shows up in the Apple menu. What you see in the
>apple menu (Microsoft ripped this off with the "start" menu several years
>later), is actually a listing of files in that directory. It is
>fundamentally elegant. With the start menu, your system is hiding more
>complex goings on because it isn't directly tied to something like what is
>actually in a file-directory."
>
>"Complex goings on"? They're shortcuts to the actual files in their
>respective program folder. This is neither complex or hard to understand.

Then again, it's not as straight-forward as it could (should?) be. There's a
lot of stuff inthere you can't move/alter. Why do I have to put up with a
"Programs" item? Why is'nt the control panel more flexible (as in has a
submenu)? Because Microsoft decided for me how it should look.

>"This creates a disparity between what the user does and what actually goes
>on in the system, giving the user a false sense of simplicity when the

>underlying mechanism is actually too complex for most users to figure out,
> thus requiring "wizards" to do basic housekeeping."
>
>I've got a question: Who cares as long as it works? Again, this isn't
>complex... and what the HELL do wizards have to do with any of this? Not a
>DAMN thing.
>
>
>"Another thing I like about the Macintosh is that I don't need an
>"uninstall". It is an absurd notion on a Mac, because all the stuff the
>program needs is neatly filed into the application itself through
>user-customizable "resources". This lets me change menu keyboard shortcuts,
>dialogue texts, and any resource an application might use. If I drag over
an
>application from one disk to another, I have all the resources RIGHT THERE,
>and they can't get separated or lost from the program like with Windows
>(because you'd probably be missing a few critical DLL type files)."
>
>This is a non-issue. Install/Uninstall wizards let you choose how you want
>the program set up, and with what options. Uninstall is also a simplified
>way of quickly removing a program. And I'd bet $20 that you haven't the
>faintest idea what a DLL is, let alone having a DLL problem.

Is it? Wait until you want to throw out a program that didn't include an
"Unistall" option... Lots of stuff gets left behind, clutters up the
system...

>"With the Mac, I copy exactly ONE file to a disk, move it to another
>directory on a different computer, click it, and it still runs every time.
>This is not possible with Windows, because you have all these niggly "DLL"
>files that are separated into different files all over the hard disk, and
to
>track them down for all your applications is so complex that they had to
>invent an "uninstaller" to find and get rid of them all."
>
>This has been addressed in another post. DLLs are not "separated all over
>the hard disk", they all have assigned folders and special places.

Let's see, I did a "Find File" on *.DLL just now on my Win98 machine. That
produced a total of 1433 files, many of them duplicate, located in 93
different folders.

>"This is simply because the system was badly designed in the first place.
>Because of resources, all the cryptic files that belong to applications are
>rendered obsolete, and also made more standardized. It also means that Macs
>don't need ".txt" or ".doc" on the end of filenames just to figure out what
>they are."
>
>Again... So? And it isn't cryptic, as any regular user can tell you can
>"txt" means text, and "doc" means document. Sheesh.

Yep. And a lot of programs are constantly fighting over these extensions on
my computer. One day MP3's open in Realplayer, the next they open in WinAmp
after double-clicking them. Very annoying.

Oh yeay, txt and doc are easy. So what are "ini", "cpe", "wcm", "sfc",
"sf0"? Not so obvious to the regular user, eh?

>"If you take these almighty important letters off the end of your filename
>in windows, the system is screwed, and can't even figure out what kind of
>file it is."
>
>First off, you can't edit the extension "just like that", so your entire
>argument is extremely flawed.

He didn't say it was easy. But if you do change or remove the extension, the
system is screwed. And it can be done. I've had to do it lots of times when
my Windows machine mistook a disk image file for some sort of picture again.

>"Is it a tiff image? A Microsoft word document or an html file? The system
>just can't live without that little extension stuck on the end of it. All
>these little filename extensions are kept track of in a "registry file".
>
>Does anyone really care? Not me, nor anyone I know...

I do. It sucks eggs. I don't want one file-type tied to just one
application. On my Mac, a file opens in the application it was created with.
On a PC, it opens with en application that is tied to the file-type through
the registry. Not neccesarily the same app.

>"The archaic disk-centric filenaming conventions of C: and A: and legacy
dos
>8.3 filenaming conventions will still plague Windows users for years to
>come. It is illogical and inefficient to kludge a disk-centric C:\
>filesystem to adapt to a networked filesystem. Microsoft has had to make
>their whole OS stand on its head in order to make it work properly in a
>networked environment because C:\ is conceived of from a disk-centric point
>of view. Furthermore, Microsoft has had long filenames since Windows 95,
but
>they still have convoluted filenames like: win.ini, autoexec.bat, and
>nddend.dll, and they always will."
>
>Once more: Who gives a rats ass? So Microsoft didn't use 61 letters for
>naming those files... does this in any shape or form prevent me from naming
>my files longer then eight letters? The answer is no.

It gets annoying when you try to clean up your system. If I want to run a
lean Mac OS without any networking, it's pretty obvious that I can throw out
"AppleTalk", "Built-in Ethernet" and "File Sharing", several system files
that take care of the networking side of the OS. If I want to slim down

Windows... Well, can I throw out "Cmd640x2.sys" without screwing things up badly? Or "Suhdlog.dat"? Certainly the filename is hardly an indication here. Heck, why not just number everything? As long as the names are unique within the folder, who cares, right?

>"Something you just don't ever have to worry about with a Mac. I have better
>things to do with my time."
>
>Yes, like spouting off about "problems" that only Mac users bitch and moan
>about.

Hmmm, if I only used a Mac, I wouldn't have these problems. As soon as I boot up my PC, I do have them. But I'm not a Mac user then, am I? Do you think I come up with these examples by looking at a computer in a store without touching it? Most Mac users have at some point used a Windows machine. And then there's the everlasting source of laughter, PC-magazines. Full of these same problems spouted by PC users themselves.

>"One of the fundamental aspects of GUI design presented to a user is how
>they handle menus. On windows, you have a separate menubar in every single
>application window that you're running. This is a kludge. Instead of having
>five menubars in five windows The Mac simplifies this by consolidating them
>into a single menubar along the top of the screen. This makes it faster and
>easier to hit (no mouse overshoot to slow things down), eliminates clutter
>in the interface, and reduces ambiguity, as it changes context intelligently
>to eliminate sources of user error. (See Why Single Menubar? located at:
><URLSnipped>"
>
>This all depends on a user's preference. Although, most find the Mac's way
>of consolidating all the menus into one is restrictive and
>counter-productive.

As you say, depends on user's preference. I do find that windows takes up a lot of screen-space for itself. but then again, screen-space is cheap these days.

>"A few notes on the iMac hardware.
>
>The iMac is really the next step in the evolution of computer hardware.
>Before, I had one plug for my keyboard, another plug for my mouse, a third
>plug for my printer, and a fourth plug for my zip drive and scanner--all of
>them incompatible and different types of connectors. If you value
>simplicity, you will appreciate the fact that all four of these connectors
>have been eliminated and replaced with a single plug. I now have: a mouse,
>keyboard, scanner, videocam, zip drive, and printer all hooked up to one
>standard interface. This makes things simple."
>
>Welcome to the wonderful world of USB, brought to you by Microsoft, Compaq,
>and Intel.

With hardly any sort of peripheral available until Apple adopted it.

>" They have gotten rid of the clutter of ports on the back and replaced it
>with one universal peripheral plug.
>It makes too much sense, but some people still prefer to have a bunch of
>incompatible ports and fiddle with IRQs and bulky 25pin connectors for
their
>printer."
>
>IRQs have less to do with peripherals (like printers), then motorcycles
have
>to do with rock climbing. More astounding ignorance.

IRQ's have nothing to do with peripherals? What do they have to do with,
then? Last time I looked, every peripheral on my computer connects through a
port, and every port has an IRQ assigned to it.

>"On PCs, these legacy ports will take several years to phase out. On the
Mac
>it's a done deal. Mac users are already over that hump and live in a world
>where they don't have to worry about it. It already just works."
>
>Just because a new technology comes along doesn't mean that all previous
>technologies no longer work. Sure, I've got two USB ports on my computer,
>but does that mean I _have_ to buy USB peripherals? Well, if I had an iMac,
>the answer would be yes. Sorry, but my current devices work just fine. I
>have no need to radically switch to USB.

Someone was gonna have to take that step. If you keep legacy ports on your
computer, no peripheral manufacturer is gonna spend money on changing it's
production processes, nor put a lot of effort in developing new
technologies. The USB-boom after iMac's introduction showed that quite
clearly.

>"Furthermore fast (100baseT) networking is built into every Mac. This is an
>option on most PCs."
>
>...And you can add a NIC to any PC for $25. And don't think that you aren't
>paying for that NIC in that beloved iMac of yours.

Yep. You can. But on every Mac in the store, it's built-in. Ready to go. No
assembling, No opening the case, no driver-installing, no IRQ conflicts.

>"The iMac moves away from the backward thinking disk-centric model of a
>computer to a network-centric model."
>
>Sorry, that's incorrect. Removing a floppy drive from a computer doesn't
>make it a Network Computer.

Indeed, it doesn't. Offering built-in fast Ethernet, built-in networking support and network-bootability (diskless) does, however.

>"In five years it will be clearly evident how important it has been to
>include a fast network connection as standard equipment on every machine.
>One standard port for local peripherals, and one standard port to hook into
>the network. The engineers at Apple have made everything as simple as
>possible, but no simpler. This is the definition of elegant engineering."
>
>Definition my ass. Apple was one of the last PC makers to adopt USB, and the
>iMac sure as sh*t ain't a NIC.
>
>"The iMac's hardware design simplifies the peripheral and hardware I/O with
>a modern network-centric design, and provides a plug-and-play that works."
>
>As opposed to Windows PNP that doesn't? Sorry, that'd be wrong, too.

Would it?. Me and my colleague all recieved IBM ThinkPads from work. With Xircom Ethernet/modem cards. I suppose I was lucky, because in my case it works. I've seen countless colleagues mess with that modemcard, where Windows asked for drivers, the floppy was inserted, the software was said to have been installed, only for Windows to ask for the drivers again after a restart. That's not plug and play, that's plug and try and plug and try, and still it won't work.

>"For those that need more performance, add a fast firewire bus as standard
>to the motherboard if you get a G3 pro tower. This provides a superb
>interface for high-bandwidth high-storage applications like video editing."
>
>IEEE 1394 isn't Mac only. Sorry to burst your bubble.

No it isn't. But it does come standard on every PowerMac, like he said. What's your point? Oh, on Apple computers it's called FireWire. That's because Apple invented it.

><Picture of G3 processor next to Pentium II>
>
>"The iMac contains a G3 processor. If you actually poke your nose into the
>box to look at the "engine" -- you will be struck immediately by the size
>differential between an Intel Pentium and a G3 chip. The Pentium is almost
>quadruple the size of the g3 to do the same function. How is it that that a
>g3 chip can process faster than a Pentium chip, be a fourth the size, and
>run cooler? Well, it has to do with better design."
>
>First off, the Pentium in that picture has a oversized case to house the
>heat sink. If you'd take a look at the Pentium without the case on, you'd
>see that the actual processor is the same size as the G3. Even if the actual

>chip was bigger, who really cares? How does it effect me, as an end user?

The Pentium processor core is bigger than the G3's. And that does matter for
reasons of efficiency, power-consumption and heat-generation.

>"The Pentium chip uses a "complex" instruction set (cisc) -- it contains a
>lot of legacy work-arounds to accommodate archaic instructions going back
to
>the first 8088 microprocessor used in the first PC in 1982."
>
>Another fallacy, which shows that you know less about modern processors
then
>Andy Rooney.

It does accept those instructions, though. The Pentium is still an x86
processor, based on the 8086.

>"This was a 16bit architecture (think lanes in a highway). Now the Motorola
>series of processors started out life with a simplified 32bit-instruction
>set (RISC). This allowed you to get more horsepower out of the chip with
>fewer parts. Less parts means smaller size, and uses less power. When Intel
>wanted to go to the Pentium, in order to remain compatible, they had to
keep
>the old 16bit stuff in there even for newer generations of chips. This
means
>they need more parts just to make a Pentium work around the old legacy
stuff
>than Motorola needs to make their whole g3 chip. Because it has a less
>convoluted architecture to move data around in, a 250Mhz RISC chip does the
>same amount of work as a 400Mhz cisc chip, and is smaller and produces less
>heat to boot."
>
>I really, really feel sorry for you if you truly believe that to be the
>truth. I'm not going to bother going into detail on this one. It's been
>debunked countless times by myself and hundreds others, but some
ignoramuses
>like yourself fail to see the simple facts.
>

>Are you Steve Jobs? Your RDF looks an awful lot like his...

Hello? You don't have to be Steve Jobs to figure this one out... Let's see, my ThinkPad runs a 300MHz Pentium II processor. For that, it needs two fans to keep it somewhat cool. These are running all the time, sucking the juice out of my battery, resulting in about 2 hours of disconnected computing. My PowerBook G3/400 has a fan that I have never heard running yet, runs for about 4 hours on a battery, or 8 on two batteries, and is a lot faster. In fact, it is the fastest notebook in the world.

>"Last, but not least. The Mac doesn't have a y2k problem."

Here's some reality for you. No Mac ever made has Y2K issues. It's a nice list, at http://www.apple.com/about/year2000/ , a long list of machines on one side, a long list of the word "Complies" on the other.

Now tell me why you posted this Mac/PC stuff in the Atari advocacy newsgroup.

Keep on swinging your sentiment is heard around the world.
M$ had a team of people in the early to mid-nineties posting trash
on everybody but them, true or not they posted away. Too
few people these days are capable of thinking for themselves.
So they bought into the MikeySoft mind share.

I especially like sites that use that active x thing to close WinBlows
browsers.

He wanted sinclap to read and respond to it.. Thanks for doing so..

sinclap will be out of the office until next Friday and will be in
Chicago to get the marching orders for the rest of the year. Will be
checking email and voice messages periodicaly..

You're pretty good at the former, but clueless as to the latter.

You don't know about desktop video.. period. The more you open your mouth, the
more
you prove this, so I completely understand why you continue to ignore my posts
about
this.

There are plenty of places where you can learn, though.. you might start with the
video lab at Apple, just off 280, where they compatibility test AVID, Media 100,
etc
systems. Email for the gentleman's name.

Before people go into denial, think about this: The Apple PowerMac G4's are so fast, that the US government doesn't allow them to be exported to certain countries because it is classified as a supercomputer. So there!

of course, since TiFKAS has shown no proof that he is actually an "Apple Power Rep", his claims are therefore suspect. Any moron can go onto Apple's web site and get info.

>
> These silver and whites are upto three times faster than the
> Pentiums...Of course a certain chunky person will be in denial...

of course, TiFKAS is once again talking about his imaginary friend who doesn't exist...

and funny thing, the people who seem to be questioning the speed of the new G4 are actual Mac users themselves in comp.sys.mac.advocacy, you know, the place TiFKAS is afraid to go to because he'll be burned beyond recognition.

Expect
> the reality distortion field to blind the reality...

yes, as done by the master of it - Steve Jobs, the main reason why TiFKAS' breath smells like shoe polish.....

so what - certain other things can't be exported to other countries without certain checks and balances. I couldn't imposrt a 68882 chip into Canada without signing some major forms proving my identity - is the US government so paranoid that I'll sell it to So Damn Insane?

what I find interesting is that "Alien" (who hides behind a pseudonym on Hotmail) is the only one who defends The iDiot Forever Known As Sinclap's idiotic claptrap. Or is "Alien" TiFKAS' personal sock puppet?

Yeah, it's illegal to export beef from England into Europe, and you have to fill out a lot of forms to export cars from one country to another, too. That's not my point. I said it's illegal to export it to certain countries *because it has been classified a supercomputer*. That's what I said. Spot the difference?

I wasn't defending "sinclap's claptrap". I was stating some additional info.
I do not hide behind a pseudonym, Alien is a nickname I've had for ages, and
that hotmail address is real. I just don't wanna post my home-account on Usenet.

Greetings,
Alien.

Recently, when I challenged The iDiot Forever Known As Sinclap regarding his accuracy in dealing with the fact that there is no evidence that the iMac is doing well in Canada by mentioning his championing an article last March in Canada's least trustworthy newspaper, the National Post (aka The Daily Tubby), he whined that he never said that the iMac was sold out, but that it was merely in "short supply".

Oh, really, TiFKAS. Then why did you post this article on c.s.a.a under the title "iMac Sold out Up North" back in March?

� � � � � � � � � � � � � �Want an iMac? Join the waiting list �

Paul Brent � � � � � � � � � � � � � � � � � � � Financial Post � �

Strawberry, blueberry, grape, tangerine, or lime. �

No matter which is your favourite flavour, chances � � � � � � � are slim that there's an iMac computer waiting for �you on the shelf at a nearby Apple dealer. � �

Supplies of the bright, translucent iMacs are� "severely constrained." That's Apple Canada Inc.� PR-speak for "sold out until April." � �

"The demand even exceeded what we thought it would be," said Dennis Manning, an Apple Canada� spokesman. � �

Grape, the most popular colour, has been consistently out of stock since the product's� introduction in January. Likewise for blueberry and strawberry. � �

An enterprising would-be iMac owner might be able to track one down in lime, the� least popular colour. � �

The computers, which sell for about $2,000, are a hot commodity because they do not� look like their competitors' boring beige boxes, plus they are configured to run� applications such as games faster than IBM-based machines that can cost twice as much. �

"What Apple has done is dragged the computer sector into the mainstream of � marketing," said Mr. Manning, the spokesman.

<snip>

As you may remember, after the article appeared I did research around Toronto and found iMacs at every store in plentiful supply, and at many of them in ALL FIVE COLOURS. Indeed, one salesman at Computer City told me that the article was "greatly overstated" regarding lack of iMac availability. I also found a large number of "Rev B." machinesthat were being blown out at fire-sale prices.

After that posting TiFKAS whined that they'd ALL be gone by March 15th. But when I retraced my steps on the 15th and discovered NO REAL CHANGE, TiFKAS had a major hissy fit.

Now why could that be? Could it be that at $1,899 CDN that the iMac is indeed overpriced and underpowered? And could it be that, rather than doing legwork like any good journalist should, the writer at the National Pest simply did a rewrite of an Apple press release?

TiFKAS, of course, then found an article from the Montreal Gazette and figured that because the paper leaned more towards the left that it would negate the damage caused by his championing the Tubby article. Close but no donut, TiFKAS - it merely was another example of another journalist who didn't do his homework (why only interview two small stores? Why not interview Future Shop and Computer City, the two major chain stores in Canada who sell the iMac, and who have many stores in Montreal and across Quebec? Why was, according to my brother, who works at a Mac store, Apple trying to get rid of Rev. B iMacs that were set up for the French-Canadian market that were glutting up their Cupertino warehouses by selling them at greatly reduced prices to other stores?)

so, it appears once again TiFKAS is in denial, and is once again trying to rewrite his own history�when it comes to his trolling and complete ineptitude towards computers - just like his claiming "I was never reprimanded by cedarnet.org for violating user agreements" (he was) or "I never called Calamus crap" (he did). And it also explains why he has suddenly stopped responding to Particle Salad after the Salad conclusively proved that TiFKAS has NO knowledge of how the video market works, has NO knowledge of use of video software, and therefore has NO credibility in this forum on this or any subject. Indeed, TiFKAS has been caught many times with his pants down to his ankles when his many claims about how Atari hardware and software "can't cut it" turned out to be stuff he made out of whole cloth, or proven to have been badly researched.

The conclusion? TiFKAS not only can't tell his ass from a hole in the ground, he also thinks he's an ostrich.

By the way, The Daily Tubby is under a constant watch by Canada's answer to Private Eye and Spy magazine, FRANK, who runs a bi-weekly column on the gaffs, mistakes and plagarisms on the paper run by right-wing kook Conrad "Tubby" Black, who is ever so much an idiot and bully as TiFKAS is (he once threatened to "horsewhip" a female journalist for daring to write an expose on his crony Brian Mulroney, and recently got into hot water when he wrote a letter to the Toronto Star in which he claimed that right-wing dictator and human rights violator Augusto Pinochet had gotten a "bum rap" and was really a great humanitarian - sh'yeah right, Tubby, and monkeys can fly out my butt) - indeed, Mr. Black is currently trying to sue our Prime Minister for allegedly blocking his chances to becoming an English Lord, despite the fact that it's against the law for Mr. Black to accept such a position....

I fully expect TiFKAS to respond in a way that includes mentioning his imaginary friend "Chunks", a person who only exists in Mr. Sinclair's mind who is obviously a projection of his own vile personality, as well as the equally imaginary "Atari Jihads".

Sinclap, did you see the recent FCP review in MacAddict? Yep.. another great review. But guess what product they compared it to? AVID? No, they knew better.. they compared it to Premiere.

Why do you think they didn't compare it to an AVID? Probably because they knew that only a MORON with no knowledge of the video market would make such an idiotic comparision. If the shoe fits..

BTW, I'm looking forward to the G4 upgrade cards when they come out. It's too bad that the upgrade cards currently will NOT work in B&W G3s.. another genius Apple move, eh?

and in another genius move, it now turns out that FCP is incompatible
with the G4! This is according to a Mac user on comp.sys.mac.advocacy who
was at
Seybold.

In defense of the G4, though, it's nice to see that Apple now has
proper math-coprocessing, and it's also nice that they've got a more
mature colour to the box (no more Smurf boxes! - guess we'll be seeing the
Smurf boxes going at fire-sale prices), and the clear handles are cool.

Too bad the Steve Jobs Reality-Distortion Field (tm) was laying it on
pretty thick - I mean, comparing the G4 to a Cray? Claiming that it's up
to four times as fast as the identical Intel? Even long-time Mac users in
mac.advocacy are questioning Jobs' tactics.

(Mr. Burns mode ON)

"You call THIS a SUPERCOMPUTER!"

(Mr. Burns mode OFF)

And using an analogy a step further, Sony has dropped the price of the Playstation to $139. Using TiFKAS' yardstick, they're doing that because they're scared of Sega's Dreamcast. (Actually, it's because the new Playstation II is coming out next year).

And speaking of Sony, an issue of MacAddict has now officially pronounced the Virtual Game Station dead after Sony won their injunction against Connectix. This despite TiFKAS' crowing that Connectix would prevail in court, and that after TiFKAS' previous prediction that Sony would licence VGS (which Sony said they would NEVER do). Next on Sony's list - bleem!.....

another great post, Mark. And one that TiFKAS will be too chicken to respond to...

It's sad, isn't it? But I must agree - among all the Windows browsers
I tried the last two weeks (I'm converting my mom's old 486 into an
Internet-savy system), MSIE5 was the least obnoxious.

>are so fast, that the US government doesn't allow them to be exported to
>certain countries because it is classified as a supercomputer. So there!

Come on, be serious. The PowerMac is fast because of the G4 processor, so
if I put a G4 "soon to be here" upgrade card in a Amiga or Atari, these
will be classified as supercomputers also?
Supercomputer? my ***!! there's nothing super at all about the Apple, there
never has been and there never will be. All you get is a nice bubble full of
marketing hype. Once you switch on the flashy box it's the same old hat...

BTW: what the US government allows or not is ridiculous... If for example
Saddam wants a truckload full of G4 processors, he'll have them tomorrow.
As an exemple: I live in Belgium, and as a Belgian citizen have nothing to
do with the laws of the US Government. If I buy a G4 tomorrow, and decide
to sell it next week to one of the "certain countries" I'm not doing
anything illegal. Just "free trade" :-)

Apple, IBM and Motorola are Multi nationals designing and producing chips,
processors and parts all over the world. How do you control a Multi
national firm? What makes you so sure that the G4 is a 100% developed in
the US processor? Ever heard of India? I wouldn't be suprised if that
country in on the "certain list" also :-))
Times have changed, we live in a global community, ever thought about the
fact that your bank account is not administered in the US, but possibly
somewhere on a server in the Phillipines. That famous export list is nothing
more then a way to control economies and protect the home market.

To use the words of the Great Guru himself: "Let's think different"

Cheers from Belgium
Dennis

Richard Murray <no.spam.heyrick.co.uk> wrote on 31-08-99:

Hi Richard,

>Philippe Duchenne is Belgian, yes? Does he know that
>Bill Gates has enough money to pay off Belgium's entire national debt?!?

Nah, I don't think so, our national debt is so gigantic, that even Mr.Gates will have to pass :-) he'll need to sell a whole lot more shitty OS's and clumsy Office suits before being able helping us out....
Somehow I don't think Belgium is in his good books either, since we called him welcome with a couple of fresh cream pies...

>MSIE5 was nice, integrated, responsive. All this on a P75 upclocked to
>100MHz. It did the web stuff, and stayed online for two hours without
>bombing out.

I have no idea what you've been using before this, but it must have been a pretty piece of lousy programming. On a humble Atari I manage to stay online for hours, without the software or hardware letting me down.
Comparing crap with crap doesn't make much sense does it?

>RISC OS has scrollbars that change size and fairly accurately reflect not
>only the scroll position, but the amount on-screen relative to the total
>amount. This message, currently, has a scrollbar half the size of the
>scrols slider space, because half of it is visible.

This sounds familiar....:-)

>Because Acorn created something good and usable on a budget that is
>probably laughably small in computer-company circles. And it wasn't put
>together by a team of coders several hundred strong.

And this is familiar also, one doesn't need the big mega firms for decent software, in some cases you're better of with a program coded by one man, who knows it inside out, then with the crap some firms produce.
A nice example of this is the Jinnee desktop compared to the famous Mac desktop. Once a person used Jinnee running under MagicMac he'll find it very hard to return to the clumsy out of date Apple desktop... Jinnee is coded by one single person, who even has a daytime job...

>Compare, for example, RISC OS (I'm posting from comp.sys.acorn.advocacy)
>and Windows.

This is familiar also :-)but that's what makes computing fun, even though you are on a system no one hardly knows, you can still do the tasks you need and in certain cases even better.

Whenever I mention that I'm a Atari user, people seem to think that I'm sarcastic, ironic or simply told a joke. They can't get it through their brainwashed Microsoft or Mac brain, that there are other systems available which have their own merits...

Cheers from Belgium
Dennis

PS: don't worry about our national debt, nobody over here does this. Next year when the Euro finally arrives, the rest of Europe will pay it off without realising it...:-)))

Still in denial?

Here is Robert Morgan's analysis...

http://macweek.zdnet.com/1999/08/29/rfithurs.html

Bulls and bears
              OK, back to other companies' responses to the G4 boxes. I

don't know if the muffled screams I'm hearing is one of them being mauled by that ravenous bear, or whether the bear's cub just took a swipe at one of their backsides as they run away. We'll see.

First and foremost, let's talk about Scooter. Scooter sells a lot of boxes as servers, even though its strong-selling workstations are in effect being used as servers in place of their more-expensive brethren. And Scooter makes a lot of money from selling them. Doesn't matter as long as they sell. Yet once the MP G4 boxes are announced and start shipping, Scooter might have the same problems that others are facing. Apple is raising the bar as far as the price-performance ratio is concerned. If Apple ships just a dual G4 and not the quad-four, G4 X 4 boxes, the price-performance ratio will start rivaling a lot of boxes that cost $40,000 or more. Especially given the extensibility of OS X Server as well as the fact that it gets along with numerous Unix versions. Toss in compatibility with Oracle's applications, and a lot of eyebrows will go up.

Now, am I saying that Scooter is going to have serious problems in the near term? Of course not. But all things considered, would you rather spend $10,000 on a box whose performance is comparable to a $20,000 to $40,000 system, or would you insist on spending that extra money?

Next up is Avid. Remember my bearish comments and sentiments on Avid when it announced its forced migration to NT over the objections of its Mac customers? In my estimation, Avid basically slit its own throat with that decision. Well, Avid is now saying that it will support Apple's G4 boxes. Several of The Heretical Monks -- myself included -- had a great belly laugh over it and came to the conclusion that it was probably too little too late. Avid could have had the digital video and audio markets handed to it on a silver platter, but it would have meant going software-only and jettisoning proprietary hardware solutions when it came to Mac offerings.

Neither Steve Jobs nor Apple wants to depend on only one vendor; when Avid balked, other solutions were developed as alternatives. (And I'm not only talking about Apple's homegrown Final Cut Pro.) Others will notice the opening and exploit it. Avid forgot that nature abhors a vacuum. And trying to say "Never mind," might be too little too late. Shorting Avid might have been prescient. We'll have to see.

On a related front, SGI is basically in the same boat. Some observers have characterized SGI's latest restructuring moves as a going-out-of-business strategy. I have a hard time arguing against that notion, even though the company is going to use MiPS in what you could call a "SGI Classic" and even if it uses Linux as the OS. About the only thing stopping a full-bore stampede away from SGI is that it was chosen as the development platform for Sony's PlayStation 2. My biggest problem with SGI: What if Apple ships a digital video and audio solution that rivals its offerings for price and performance? (Is it possible? Yes. Very possible. If not now, within the next year or so.)

What both Avid and SGI have in common is that their core businesses and markets of high-end graphics and video are moving very quickly toward digital video and audio -- a market that Apple is focusing on with hardware and software solutions developed in-house and by its third-party vendors. When it first surfaced, this new direction prompted many members of the Greek chorus to start moaning, groaning and wringing their hands, until I informed them that just because Apple is focusing on digital video and audio publishing doesn't mean the company is washing its hands of traditional publishers. After all, there's nothing stopping publishing pros from employing those solutions for traditional publishing. Most of the naysayers came in off the ledge when I pointed out that the G3 boxes they were currently using already had video capabilities, even if they didn't use it.

The key point here is that Apple's product offerings will soon surpass those of Avid and SGI when it comes to their price-performance ratio -- and possibly on performance alone. When Apple first launched Final Cut Pro back at April's National Association of Broadcasters gathering in Las Vegas, a lot of video pros said the software was good enough for about 80 percent of their work and that if future versions met the features of Avid's solutions and offerings, then that figure would rise to about 95 percent to 100 percent.

Why am I focusing on Avid and SGI while discussing the new G4 boxes? Because the majority of Mac users don't use them to design and test nuclear bombs. Most pro markets use them for "creative world"-type applications, including design and publishing, video, and audio.

But what really got me laughing is that critics of Apple and the Mac platform who had been insisting that the PowerPC chips weren't fast enough because they didn't go to 500 MHz are now downplaying the importance of speed. Is it because the G4 chips are not only in the 500-MHz range with the first boxes shipped and that those 500-MHz G4 chips are faster than a comparable Pentium III? Processor envy? Oh well. No matter. Price-performance is what will sway the target market for those G4 boxes, not whether they can sit there and tell others, "My processor is bigger and better than yours." It's not the car but the driver.

> > BTW, I'm looking forward to the G4 upgrade cards when they come out. It's too

$1600 for a G4 box with modem is Thinking Different!

$1000 for a Hades with early 90's technology or for $600 more an upto
date mind blowing box? What would you chose?

>   Too bad the Steve Jobs Reality-Distortion Field (tm) was laying it on

Probably, yes. I'd really like to see that. But I'll keep my Atari's stock now.

>Supercomputer? my ***!! there's nothing super at all about the Apple, there
>never has been and there never will be. All you get is a nice bubble full of
>marketing hype. Once you switch on the flashy box it's the same old hat...

No it isn't.It's a well-designed case with a high-quality computer inside running an OS that allows me to get my work done without crashing constantly. Unlike a certain widespread OS from a certain Redmond software company.

>BTW: what the US government allows or not is ridiculous... If for example
>Saddam wants a truckload full of G4 processors, he'll have them tomorrow.

>anything illegal. Just "free trade" :-)

I wasn't saying that the US export restrictions aren't ridiculous. I know that people that want these machines will get them, one way or the other. There are discussions going about raising the specs. All I said was that these restrictions apply to the PowerMac G4, because by US government standards, they're supercomputers. A stock Atari, Amiga, or any Wintel machine isn't. According to these standards.

As for free trade, trade is not always as free as think. If you buy a G4 in Belgium, wether or not you are allowed to export it to Saddam Hussein depends on Belgian export law. There might just be some restrictions on that. Of course, you could just do it anyway without registering the export, but that would still be illegal.

>Apple, IBM and Motorola are Multi nationals designing and producing chips,

>national firm? What makes you so sure that the G4 is a 100% developed in
>the US processor? Ever heard of India? I wouldn't be suprised if that
>country in on the "certain list" also :-))

I don't think that IBM and Motorola have their processors produced in countries like India. Maybe a lot of more "mundane" chips are produced there, but not the cream of the crop. And I'll bet that their top designers are in the US also.

Apple has outsourced production of the iMac to companies in Taiwan and Korea, but the PowerMacs are being produced by Apple at Apple's factories in the US, Singapore and Ireland.

>Times have changed, we live in a global community, ever thought about the

>somewhere on a server in the Phillipines. That famous export list is nothing
>more then a way to control economies and protect the home market.
>To use the words of the Great Guru himself: "Let's think different"

My bank account is most certainly not administered in the US, it's on a huge mainframe in Amsterdam. That mainframe runs software that I have written. Contrary to what you may think, if you have a bank account, it is probably administered on a big mainframe that is fully owned by the actual bank itself. Not on a big server in the phillipines. Banks are very (*VERY*)

privacy-sensitive operations. They develop most of their software in-house and
run it on their own mainframes.

Imagine how fast that Fiesta would go ;-)
I don't know about the Atari upgrade cards, but on the Amiga front the G4
cards announced (avail October) have a graphics card option which is
connected directly to the G4's bus. No bottlenecks.
Onboard SCSI means that there are no additional bottlenecks in that
department either, and the addition of onboard PCI connector and USB ports
is a bonus.
Add to that transparent 680x0 emulation built into the card as well and I
can't see how such an upgraded Amiga would be slower then a Mac with a G4
processor.

Perhaps you could enlighten me?.

think Apple still has clout in the graphics sector? Think Again. Looks like Adobe has made their decision on what is cutting-edge regarding systems they can recommend - and just a few days after Apple debuted the G4 with their laughable "it's a supercomputer" FUD at Seybold. Looks like the Steve Jobs Reality-Distortion Field (tm) backfired. Any bets Jobs is having a hissy fit back at Cupertino?

this message was found at comp.sys.mac.advocacy....

http://www.dell.com/corporate/media/newsreleases/99/9909/1.htm

Dell Computer Corporation (Nasdaq: DELL) today announced that Adobe Systems Incorporated (NASDAQ: ADBE), one of the world's largest software companies, has selected Dell as its corporate standard worldwide for workstations and desktop PCs.

"The Dell Precision WorkStation 410 is great for our engineers, because it provides the power they need to create the award-winning graphics software our customers have come to expect. The benefit for our customers comes full circle now that Dell has begun to offer the Adobe Collections as an optional bundle with Dell Precision WorkStations," said Gerrard Rutter, vice president, Information Systems, Adobe. "For Adobe, Dell's OptiPlex G1 is a very cost-effective solution for general office work. By using DellPlus factory integration, Adobe is able to provide employees with systems that are fully configured and customized from the moment they open the boxes and plug them in."

Adobe has purchased more than 850 Dell systems for software development and general office applications. Systems are ordered via Dell's Premier PagesSM service, which provides customized, password-protected Web sites that Dell creates for institutional and business customers. Dell's Web site currently hosts more than 27,000 customer-specific Premier Pages.

and where I found it?

http://www.macaddict.com/

Guess when it comes time for Adobe to put its money where its mouth is, well . . . . .

well, it looks like, despite TiFKAS' claims to the contrary, and despite how allegedly well the iMac is selling in the states, InCompUSA is in serious financial trouble again. And if they go, Apple can kiss their only national supplier goodbye - and is kicking themselves after their bully-boy tactics with Best Buy backfired.

as usual, found on comp.sys.mac.advocacy (the place where TiFKAS is too chicken to tread)...

http://dailynews.yahoo.com/h/ap/19990830/bs/compusa_layoffs_1.html

Intersting, they're letting go 1,800 employees, or, as the article states, half of their commercial sales staff.

I always wondered if CompUSA could get worst. It seems it CAN.

CompUSA always has tons of people in when I visit - why the layoffs?

I thought your imaginary friend "Chunks", who doesn't exist, was
supposed to be an equally imaginary Atari Jihad?

No fine print, bubba booey. It's also listed on CNN's web site as well, major news story. Appears to be even WORSE than in that story, 1/2 the sales staff have been canned, and several stores are having the plug pulled. It's also become a major topic of discussion on comp.sys.mac.advocacy.

The
> layoff occured in their instore corp dept. CUSA has streamlined to

now of course, we get the voodoo economics damage-control spin from TiFKAS. No surprise there, as he may have a vested interest in Apple's survival (of course, because he absolutely refuses to show ANY evidence that he's an "Apple Power Rep" using as his pretence the lamest of excuses, we can only surmise he could lose what little trolling capability he has).

I'd suggest doing your homework and going to the CNN site yourself if you don't believe me, troll-boy...

>
> As for BB, a missed opportunity.

yep, for Apple to have better national distribution. Too bad BB didn't want their stores to act as Apple's warehouse for unsellable iMacs.

>
> Sent via Deja.com http://www.deja.com/
> Share what you know. Learn what you don't.

what TiFKAS knows - NOTHING. What he's learned - NOTHING.

> others.

Funny or... ?

Well, some are based on humourous statements (like the now famous
Bill Gates' "640k") and popular Microsoft jokes and one-liners.
Some are denunciations of Microsoft's bad practises.
Some are aimed to restaure computer history:
 "No, Microsoft did not innovate the mouse"
 "No, Microsoft did not innovate Internet"
Some were drawn to counter dis-information:
 "You don't NEED Word to do word processing"
 "You don't NEED Internet explorer to surf the WWW"
Some give hints on how to use MS-product in a more user-friendly way.
Others inform of the existence of alternatives and open and free standards.

All of them have a mockering touch of humour (the cream pie), but the
base idea is to spread a real message.

>>
>> Do you really think that everybody who advocates open standards must be
>> making a joke at Microsoft's expense?

>>

> Although some are specifically supporting open standards, many of them are
> simply bashing.

That's right.

It's a demagogic decision I took as I found out that bashing usually proves to be popular, and jokes spread very fast. And to be totally honest, I sometimes like that too ! :-)

Hello there irfon !

On 26-Ao�t-99 14:01:04, you wrote about Re: [MS-bashing] New collection of anti-Microsoft banners :

> I totally understand where people are coming from on this issue, and I notice that this is cross-posted to a wide variety of newsgroups addressing different OS communities,

Yes, as people here have knowledge (experience) of something else than Wintel; and advocacy groups are probably the best places to find people ready to defend alternatives to Wintel.

> but I honestly think that it is the wrong track to take, both for those of us who are relatively new on the scene (I'm posting from the BeOS group) and those in the more established communities.

Hmmm, maybe.

A banner campaign such the one I started at <URL:http://www.ping.be/amigaphil/README.html> is probably not the best way to declare that something is going wrong and we must step in before it's getting worst, I must admit.
It's just my 2p.

> As soon as you define yourself solely in terms of another, I think you lose a lot. I've never been a fan of political campaigns where the whole push for a candidate centers around what's bad about the other candidate, and similarly, I always wince when somebody asks what should interest them about BeOS and people respond saying, "Well, it's not made by Microsoft!"

Yes, that's a weak argument.
But since, there's a point here:
Not using Microsoft's products at all give you a better chance to not being tied to Everything Microsoft.

> If a product cannot stand on its own merits, then it's not much of a product, and I'm sure none of us would like to think that we are using our chosen platforms for that reason and that reason alone.

> Here's an exercise we should all do :

> Step 1 : Sit back and think only positive thoughts about your computer. Think of the thinks you like to *do* with it. Think about when you are happiest and what you're using your computer to do when that occurs.

> Step 2 : Write a short essay to your favourite advocacy group explaining what you do with your computer that makes you happy. Do not use the word Microsoft, and do not compare your platform to any other platform. When composing this essay, try to express yourself using only positive language. Do not mention

> what you're glad your computer does *not* do. Mention only what you're glad it *does* do.

Ok. But preaching in your own chapel won't help newcomers to have a wider range of solutions to choose from.

How about people who think a computer is a machine that run Windows, that Microsoft innovated the mouse and the GUI, that you need Word to do word processing, that you need IE to surf the Web, ...

> Step 3 : Lie back in bed before going to sleep, and work through this scenario -- Microsoft has disappeared from the world, along with all of their products. (This is not a fantasy of mine, just part of the setup.) Think about your platform in such a world. What defines it? What makes it unique? What drives its users and breathes life into it? What sustains developers' passion?

Then pray that Apple won't take Microsoft's place and start to re-build computer history and future for it's own profit.
Pray that your favourite development teams won't be buy-out and stop writing applications and drivers for your machine.
Pray that nobody will try to convince you you need a Mac and MacOS to be on Internet.

:-)

Think of what you can do to prevent any attemp to create a new monopoly control on the computer industry.
Think of any help you can contribute to build better common "languages" for the whole world to share the happiest computer experiences.

> These are the kinds of issues and thoughts we should concentrate on if we want to succeed, or even if we want to have a healthy, happy computing experience. Spending your life hating Microsoft is a waste of energy which could be used to forward the positive cause of your platform instead. In the words of Henry Rollins, "You're giving them too much of yourself." Hatred is the path to the dark side, young jedi. Use your powers for good, not evil.

Hating is not constructive, indeed. But closing our eyes (or worst, closing other people eyes) on a menace to the freedom of the choice we can expect to have in our computing experiences is not, either !

As I tried to explain in a previous post, this kind of campaign is probably not the best way to put a spoke in Microsoft's wheel while they are at the conquest of the world. But I hope this counter-propaganda will bring curiosity to some unaware people:

 "Why are all those people bashing Bill Gates ?"
 "What's wrong with Microsoft ?"
 "Why is this guy telling me my web site is not user-friendly ?"
 ...

> Firstly, I quite *LIKE* MSIE5 [...]

Nothing wrong here. It's your choice and that's good.
Hopefully, you are aware as to what to avoid to respect the choices of
other people.
(Hope your Web site won't bear a "Best Viewed with MSIE" logo ;-))

>>> A new collection of "Anti-Microsoft" Web banners is available at

> company and one man.

Sure !
I would have build such an informative site if I had time and patience.
But other people do that better than I can.
The banner campaign is my humble attemp to defend the same cause.

> Philippe Duchenne is Belgian, yes?

Yes.

> Does he know that
> Bill Gates has enough money to pay off Belgium's entire national debt?!?

No I didn't. But I'm not surprised either.
What's the point here ? Does that make Bill Gates a holy man ?

Money does not wash more clean. Otherwise the drug mafia could use part
of its dirty money in donations to hospitals and gain acceptance and
impunity. (Er... ?   ;-))

> Anyway, to describe something as "Good because it isn't MicroSoft" is worse

Agreed.
"Good because it isn't Microsoft" is an easy short-cut reply to those
"Best with Microsoft" or "Only possible with Microsoft" we are inundated with.

>>> Those are based on a "Microsoft FREE" seal (16 colors, Netscape palette
>>> used)

> slider space, because half of it is visible.

Would you like me to draw a "RISC OS has a better scrollbars handling than
Windows" banner and spread it outside the Acorn community ? ;-)

Who knows ? It could help to make a few people curious about what RISC OS
is.

> Win95's font smoothing works. But it is evil. To get MSIE to display a

Same here (but that won't fit in a banner :-)).
And you could even catch the attention of a few more people.

> Impressive. Now if only the base OS was that good. :-)

We can't blame Microsoft for everything they do. Microsoft *DID* many
good for the whole computer industry. But the way they are using their
power to erode other people's freedom to grab even more power is just
unacceptable.

The Mac Jihad 'Chunks' must of not read the easy to read print. The
layoff occured in their instore corp dept. CUSA has streamlined to
eliminate duplication in multi CUSA markets. According to the press,
1100 have accepted positions at the new corp call center in Dallas.
CUSA store focus will be retail with additional staff.

As for BB, a missed opportunity.

Will do...Don't forget 100 mhz buss... speed, 66 mhz PCI slots, fast AGP
slot, three firewire ports, built in attennas for airport etc...

Get the point?

you find IE5 works? open more then 10 windows? - it crashes - I have PII333
etc and AMD 350 both machine crash like hell running Windows 98 - I had to
type a letter on my A3010 the other day!

Its crap - Netscape if you got to use PC!

did you know that if you design a web site with HTML the right way it looks
crap in IE!

So you have to put more code in for IE and then waste time, downloading
etc - IE3 is very bad from this point of view!

As a RISC/Acorn user I thought you have pride in a OS that has small coding
etc!

or I may be wrong

Adam

Hmm... IE5 doesn't like more than ~30 windows on my PII400, at that point
it tells me I out of memory.
BTW I doesn't crash even if I have ~30 windows open.

> Its crap - Netscape if you got to use PC!

I would say that you have a crappy designer, I can make a web site look
good with just about any browser. Though it may not look the same in each
one, browser offset is one problem and there are other problems. I problem
I have is not all browser (including different versions) do the same thing
every time.

They probably are, but who gives a shit?! All it means is that soon you'll need to upgrade to a G4 just to play the latest games on a Mac! It smells of the Wintel world I tell ya!!

...and they keeps comin' up with da money...poor fools...

Kind regards,

Too true. And the USA has the gall to promote 'free trade' with other nations
including my home country of New Zealand, and then turn about face and
slap a
huge tariff on New Zealand Lamb to protect its own lamb industry...the relevant
connection with computer exports I see little similarity to that
situation but
I cannot believe something 'Made in the USA' cannot be sold wherever
Apple damn
well please...

Kind regards,

30 windows? Jeez. I thought I was bad.

> > Its crap - Netscape if you got to use PC!

On the Mac the situation is somewhat reversed. IE 4.5 is the only program
that can reliably crash the OS on my G3. Netscape has crashed all of two
times ever, leaving the OS up both times. And one of those crashes was due
to me deleting its preferences folder while it was running <g>.

I've had correctly written HTML that works just fine in Netscape and iCab
and is actually compliant with the HTML 4.0 spec(!!!) render incorrectly
in IE 4.5 for Mac and render incorrectly in a totally different way in IE
4 and 5 on Win '98. Hopefully MS will fix this in IE 5 for Mac this fall
and whatever the next release for the PC is. At least IE doesn't support
the <BLINK> tag :-)

And Mozilla is due out before the end of the year. Unlike IE and Netscape
it'll strictly adhere to standards.

Funny, with the limited production the Falcon seen, there are hundreds
of Falcon specific applications available. With the introduction of
the Milan, a new customized O/S was released, with many Milan specific
applications. The way it is snowballing across Europe, it should hit
the shores here with quite an impressive package of software.

That is the most accurate thing you have ever said. G3's are just like
the old ST buckets. I commend you on your honesty.

Funny, this CDAR feels real to me. Atari Transputers are still in use
and are very desireable. Try to buy one from its user.

What would those advantages be over MiNT when installed on a TOS platform?

> I suggest you give AmigaOS a chance.
> Which version of the OS has your 2000 got?.

I had the machine running for a while with my Atari/Amiga Alpha Data Track ball, but now it won't see the the device. There is diode type Amiga mouse that came with it. I picked up an aluminum optical pad, but the curser only moves in one direction. Anyway, I haven't been able to get back in to check. It goes by to fast at boot up. The copyright date on the workbench is 92, so it is an older version. There may be a bad connection on the 9 pin din.
>
> BTW there are many workbench enhancements available on Aminet, be sure to
> check them out ;-)

It seems that the machine is missing one of its orignal harddisk and most all of the toaster stuff is gone. There is a folder of what looks to be some extensions of somesort to convert various graphic formats back and fourth, but Light Wave is not on that disk. None of the Toaster software is there either. I hope that since you have to have the hardware to use the toaster, that the software is freely available, at least the capture and editing parts. Which brings up another problem.The 880K format floppy makes it hard to transfer files that way. I don't want to take the time to set it up for internet use. I do have three EZ 135 SCSI drives. What is the best was to get compatibility with the machines format? There is an application that looks like it lets the machine read mac disk as far as I can tell. It has a shit load of disk utilites, mostly backup stuff. Anyway, it sits until I can get the mouse thing resolved.

Excuse me, but the CDAR was commercially available, and IIRC even had a CD based game (something like Golden Island? Can't remember - can someone help me out here?) as well as an encyclopedia. What year did the first CD-ROMs appear on Apple/PC's?

The Transputer was awesome for its time, and is a collectors "must have" item now...

I have to admit I'm a little confused by your designation of the 2080ST as "vapor"...or are you just showing your (Atari) ignorance?

AFAIK, 1, 2, and 4 meg Atari ST'(e)s often used the following model numbers:

1 meg = Atari 1040ST(e)
2 meg = Atari 2080ST(e)
4 meg = Atari 4160ST(e)

Surely Sinclap - even you can see how they got these numbers?

->Began under the PC...Even the acad libraries had them earlier than
->Atari's vapor announcement..

Again, not vapor. Just for the sake of argument, when was the Academic libraries first equipped with CD-ROMs, what type, computer, OS, and year, please. Thanks.

Hmmm, then the CDAR I saw in Calgary about a year or so before the
first PC CD Rom hit the shelves here was only a figment of my
imagination. To say nowt about the 2080st in the same shop (but, I'll
admit they only ever had 1 of them) !!!

Gosh, I'll have to tell my psychiatrist !!!!

That is because you probably have a harddrive missing wich may be causing
problems with termination, causing the delay.

 I really don't know much at all about Amiga, but I
> > > wouldn't trade MiNT/N-AES/Thing for what I saw any day. It does seem

Sorry, I was thinking of the advantages of Linux over Windows, when
installed on a x86 platform. Point is, familiarity is the important factor
where an OS is concerned. Unless you are familiar with both OS's that you
are comparing, you can't really make an accurate judgement.

> > I suggest you give AmigaOS a chance.

Does the Amiga mouse work?.

 I picked up an aluminum optical pad, but
> the curser only moves in one direction. Anyway, I haven't been able to

It could also be a bad microfuse on the motherboard. The microfuse is near
the port, on the motherboard, and resembles a resistor.
Also, one of the CIA's could be flakey. It is a good idea to reseat all
socketed chips on the motherboard first though. The CIA's are two 8520
chips underneath the PSU.

If you get a boot menu when you boot the machine with both mouse buttons
pressed down, you have at least Kickstart/WB 2.0.
If not, you have KS/WB 1.3 which is very outdated.

Not sure on this, but an email to Newtek should provide an answer. (or ask
in c.s.amiga.hardware)

 Which brings up another problem.The
> 880K format floppy makes it hard to transfer files that way. I don't
> want to take the time to set it up for internet use. I do have three EZ
> 135 SCSI drives. What is the best was to get compatibility with the

c.s.a.hardware is your best option. There are many Amiga utilities which
allow file sharing between different formats and the folks in the Amiga
hierachy of newsgroups know their stuff.

I use PC2Amiga which is available on Aminet. It allows any PC drive to be
used as an Amiga drive via serial or parallel linkup. (parallel is pretty
fast)

 There is an application that looks like it lets the
> machine read mac disk as far as I can tell.

That is likely. If you have WB2.1 or better you will have MS-DOS format
support built in to the OS as well. (be it 720Kb floppy support because you
only have a 880Kb Amiga floppy.

 It has a shit load of disk
> utilites, mostly backup stuff. Anyway, it sits until I can get the mouse
> thing resolved.

If you have anymore questions just email me or ask in the relevant Amiga
newsgroup.

Regards,

Clockmeister.

Wrong again. I argue with someone spreading MISINFORMATION, not opinion. If you

said "I think FCP is going to replace AVIDs for video editing," I would probably post
once that you are ill informed and that would be it.

Instead, you said "FCP has AVID running scared" and you said "FCP is the reason for
AVID's recent price reductions" and "FCP accelerates the video market." This is
clearly misinformation.. and could only come from someone who is FAR removed from the
desktop video world, and can only come from an "Apple Evangelist" without concern for
truth or accuracy. These statements of yours CLEARLY undercut any credibility you
might have ever had..

Yea.. I bet it's as extensive as the research you've done on desktop
video. Final Cut Pro taking away market share from AVID, indeed..

Its only a beginning. Just look at M$ way back when...now look
at them today! Doesn't compare does it! Of course I'd seen the
early versions of Windows (v1 and v2) and I thought they were
complete crap that my Sinclair Speccy 48k BASIC left for dead!

> My penis is fine...No complaint from the penis recepient dept...-)

So you have no callous' on your hands then? ;^)

Absolute crap!! ST's delivered new had higher reliability than
any other platform in their day...

Get it right before you open your trap!! It'll save embarrasment
on your part!!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Absolutely! Sinplop is like a Sunday newspaper...full of the sort of
crap that no half-intelligent person would even want to consider as
gospel...

> The Canadian Curmudgeon (in sunny for a change, 20C, Calgary)

Sounds nice!!! Unlike here...woke to settled snow, more snow falling,
-1 DegC, and gales yesterday. The snow eventually gave way to heavy
rain as the temperature raised to the days high of somewhere around
3 or 4C. It was impressive watching a river in central town burst its
banks with the rain/snowmelt tho'!! Yuk!!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

actually, TiFKAS is more like the Weekly World News, a collection of info that have obviously been made up that usually appears weekly, and which nobody can take seriously - and has the demeanor and lack of humour as their most prominent columnist, Ed Anger. Hence his constantly puts his foot in his mouth when he gets "pig-biting mad"....

BTW, TiFKAS, you still haven't provided evidence of your employment in any way with an Apple-related business. Ante up, COWARD.....

the theoretical NEW amiga is Linux. Hardware matters, but the reason we
like our
machines whether Amigans or TOSrs is because of the operating system and
software.
Abandonning the amiga o/s, and consequently amiga software is not
gaining users
at all, it is abandonning them.
What on earth is the difference between running Linux on an Amiga, or a
Pentium? squat!
amiga is dead. long live amiga.

alt.atari.2600,alt.games.video.classic,comp.sys.atari.advocacy,rec.games.video.atari,rec.games.video.classic

I have a huge collection of Atari games. All 330 games are different labels. Many are Extremely Rare or Rare like Avalon Hill's London Blitz and Wall Ball, or a Frankenstein's Monster Demo game that has a bright red label saying "New Game: Property of Data Age, if found please return..."; I have Xonox double-enders, Xonox single-enders like Sir Lancelot, Mythicon titles, 20th Century Fox titles like Revenge of the Beefsteak Tomatoes, games like Tapper and Up-n-Down, Jedi: Death Star Battle, and many more!

I am looking for someone who wants to buy me out completely. That means all 330 games, plus perhaps another couple hundred duplicates. Serious offers only, please. If you are near Maryland, USA, you have an advantage in that you could save money by picking it up. If you are considering resale possibilities, I also have a huge collection of Intellivision games, a large amount of Colecovision games, boxed Odyssey2 systems and games, Atari 8-bit and ST items, TI99 systems and games, Atari Jaguar, Apple II, Tandy CoCo, and C64 and VIC-20 stuff. Each major collection could be negotiated separately or bundled together. If I get no serious offers for bundled systems, I will consider selling individual titles. At this time, I am not interested in trade. US Cash or Money Orders only. Please do NOT ask me how much it would cost to ship to 'so-and-so', as I do not have a scale that could weigh everything and do not plan on hauling anything to the Post Office until I get offers. Thanks.

Please email me for detailed lists of games.

Ironically, Amiga still sells more stock A1200's a year.
Last year, just one order consisted of more then 600 units.

Comparing those sort of figures against Milan sales puts things into some
perspective I think.

Regards,

Clockmeister.

Hi Clockmeister...

What perspective? Sorry-not being a smart-alec, but we all know that the Amiga market is bigger than the TOS market. So what you just told me was that the sky is blue... <grin>

Actually, I'm glad to see the Amiga doing well. I've always had a soft place in my heart for it. I have to admit though, that I'm in fear, somewhat, of where Gateway is taking the Amiga now... ;-(

It kind of makes me think of that old adage, "we have met the enemy, and he is us" (or something like that!) Really hope that the Amiga is still the Amiga when they are through.

The same kind of thinking has been going on in Atari camps as well, more since so many clones are now being produced. I actually had a user tell me that I really didn't want to get a Hades/Milan/Phenix or whatever because it wasn't a "real" Atari computer. Well, I've thought long and hard on this, and nothing will ever be a "real" Atari computer again. However, if it uses TOS as a base for its OS and keeps the Atari philosophy, as well as "feeling" like an Atari, while bringing it inline (or more so) with current hardware/software standards, then I'll be happy...

I'm sure you Amigans have been having the same kind of thoughts and or debates...! <smile>

Later, O Master of Time... ;-)

> might have ever had..

The real irony is that FCP is a rather sweet piece of software, but since
it's Mac-only and you seem to get twelve free doses of RDF-syrup
injections every time you ask about it, it is unlikely to unseat the more
well-established products in this area from Avid and Adobe.

The idea that FCP has Avid "running scared" is laughable. The fact that
FCP is a very nice (especially considering it is at version 1.0) piece of
software is undeniable.

Hey, if they come up with an NT version, I'll use it in a heartbeat.

You know, I think it probably is having an impact on Premiere sales.. it definitely is targeting part of their audience (those who use Premiere for DV capture/editing). Agreed, it IS a nice piece of software, and will be even better next rev I'm sure.

That would be smart for Apple to do.. which probably means they won't!

On the other hand, boasting about 600 sales a year does seem a little
silly.
and it certainly isn't "enough".
I don't think it was you who made the original comments.

I can live with a Linux kernel providing the AmigaOE is Workbench-ish. A
kernel is just a kernel, and there is no reason why the new Amiga OS should
look like just any other Linux distribution. (I hope ;-)

You bet. If nothing else, there has been plenty of talk with even Jim
Collas himself getting in on the action in the c.s.amiga.misc newsgroup.
Unusual for a president of a company to do that, I hope it's a positive
sign of better things to come.

Actually mr. Sinclair,
 Atari sold over 3800 CDAR504. A significant number considering the infancy of the
product and the amount of software then available. (zero) I should know I received
mine
in 1988. The serial number is E1921000074. The vast majority were sold in the
netherlands and Germany. Less than 300 were sold here in the states. Almost all
went to
developers or Authorized Sales and Service centers. Actually I think Atari managed
to
sell more of it's CD Rom drive than Apple sold Lisa's

That would be true if it wasn't for the fact that at least 10,000 Amiga PPC upgrade cards have been sold so far. Granted, the current OS still runs on 68k, only using the PPC for the number crunching, but with OS3.5 that will change.

PPC has been available for Amiga for quite some time now, albeit an expensive option.

Regards,

Clockmeister.

<psalad@earthlink.net> wrote:

(intelligent refuting of TiFKAS' ridiculous insistence that FCP has Avid "scared" deleted)

you know, I'd been wondering that myself.

However, seeing that it was announced that DejaNews is now requiring their users to cough up $10 per year to make full use of their web-site services, and TiFKAS is notoriously cheap - not to mention the fact he has proven himself to be so completely inept at anything computer-related that he can't even set up a newsreader - I'm not so surprised.

Or is it because the little coward has finally met his match in an obviously much-better-versed opponent who has shown he doesn't know beans about the video business, and has finally realized he's been making an idiot out of himself every time he types in his drivel?

Or, perhaps, he realizes that the jig is up and his kooklike insistence that he's an "Apple Power Rep", despite his absolute refusal to post any tangible evidence that he is, is now being put under scrutiny?

Perhaps?

Well, let's see.. did you happen to see the new issue of "Newmedia?" You know, the one with a nice review on Final Cut Pro? Yea, they DID give it a very nice review.. but read the last paragraph, Sinclap.

Oh heck, I'll type in in for you.

"Ultimately, the assertion that Final Cut will go head to head with Avid is just marketing bravado. The nonlinear industry only sells a few thousand units a year, and Apple lacks the professional dealer channel and support to link to other postproduction equipment. What Final Cut is geared toward are the several thousand serious owners of DV camcorders and the professionals working in smaller studios, who now have a compelling reason to think Macintosh for video editing. (snip)"

One more quote from an earlier section:

"Unfortunately, Final Cut is not yet capable of real-time editing, requiring rendering of all transitions, titles, and graphics, which will limit its use among professionals, where time is money."

Taken from the latest issue of Newmedia, page 45, article "Final Cut Pro," written by Jeff Sauer.

Unfortunately, you don't have enough self-worth to actually admit your mistake.. but no problem. Game over, man..

-Mark

Been awhile for you, eh?

->The September issue of Money Magazine arrived in the mail as part of
->Sinclap's tools to make informed investment decisions...

I'm sure you need all the help you can get.

->The front cover shows the folks who made the biggest investing mistake
->of all. One person in particular listened to her boyfriend(ex now?) to
->purchase $25,000 worth of Atari stock and ended up selling at below
->$1,000 when the stock crashed under the fine stewardship of the Tramiel
->clan... I wonder if one the Jihads are responsible for this...

Did they mention that quite a few people made lots of money, if you judged the timing just righ? For example, right before the 64-Bit Atari Jaguar was announced, stock was well under a $1.00. Not long after, it peaked at around $15-16 or so (I don't have the exact figures here). Obviously, if this "person" Had purchased $25,000 of Atari stock before the Jag announcement, and then sold at peak later on, they would have made the cover as one of the biggest investing winners. Its all timing, Sinclap...

BTW, I notice you are still unable to correctly configure a Mac newsreader. Doesn't Money Magazine inform you on the best way to do this? ;-)

Yes, I was well pissed off about this. I think shares were something
like 1ukp before then 11ukp a few weeks later. :-(((

and again, you're wibbling on and on without proof. Plus the fact that you refuse to debate Particle Salad (a video professional who, unlike TiFKAS knows both the Macs and the market) on his salient points, but prefer to wibble on and on with the same tired rhetoric, shows who is being realistic here...

when will you admit you were wrong about trusting the Daily Tubby regarding their ridiculous stance that you couldn't find an iMac anywhere in Canada in April?

Hey, the iBook is good news for us - now, with the help of MagiCMac 6, we now have access to a wonderful portable Atari solution, running our programs faster on the platform faster and more efficiently than the bloated pigware equivalents on the Mac....

>
> >   Or, perhaps, he realizes that the jig is up and his kooklike insistence

> > tangible evidence that he is, is now being put under scrutiny?
>
> Don't need to...

Sure you do. If you want us to take us seriously to your claims that you're an Apple Power Rep, you need to provide your credentials. Failure to do so only shows that you're only pretending to everything you claim to be, and confirms that you're a "kook". Would you trust someone to handle a trust portfolio if he didn't have good credentials? Would you trust an insurance agent, or someone claiming to be a police officer or bank manager, if he didn't, wouldn't or couldn't?

Since it has been proven time and time again that, due to the fact you are ABSOLUTELY CLUELESS when it comes to computers, as well as your many spelling gaffes and unprofessional conduct, we doubt you wouldn't get past the first question in the oral interview with Apple before you were given the gate...

> Plus I gave you clues..

nope, you only gave us the facts you are clueless, weinerhead. Posting web sites articles that only produce 404 results on their host provider does not constitute evidence. Or have you changed your service provider to chicken.net?

> Not like I want to post my 800
> extension than have to have disconnected due to the spamming by 'Chunks'
> and the Jihads...

see, TiFKAS is so out of it he fears phone calls from people who don't exist, like his imaginary friend "Chunks"....

besides, any calls would be to your boss, just to simply confirm that you are employed by someone related with Apple. What are you so afraid of, TiFKAS - that it'll be shown that you only attain the job level of assistant pencil sharpener?

Once again, you prove your lack of knowledge of the industry. The Radius Video Vision Studio was a pretty good low budget choice that ran on Nubus macs.. it actually was decent quality, especially when combined with the Telecast. Also, there were several other solutions based on the Targa 1000 and 2000 boards that people are still using today to create video..

Talk about what you KNOW..

Yes, and you evidently missed the post below:

Subject:
"Sinclap's Folley".. Final Cut Pro Review
Date:
Fri, 30 Jul 1999 18:44:42 -0700
From:
Particle Salad <psalad@earthlink.net>
Organization:
Yes
To:
sinclap <sinclap@my-deja.com>
Newsgroups:
comp.sys.mac.system, comp.sys.mac.advocacy, comp.sys.atari.advocacy
References:
1 , 2 , 3 , 4

Well, let's see.. did you happen to see the new issue of "Newmedia?" You know, the one with a nice review on Final Cut Pro? Yea, they DID give it a very nice review.. but read the last paragraph, Sinclap.

Oh heck, I'll type in in for you.

"Ultimately, the assertion that Final Cut will go head to head with Avid is just marketing bravado. The nonlinear industry only sells a few thousand units a year, and Apple lacks the professional dealer channel and support to link to other

postproduction equipment. What Final Cut is geared toward are the several
thousand
serious owners of DV camcorders and the professionals working in smaller
studios,
who now have a compelling reason to think Macintosh for video editing.
(snip)"

One more quote from an earlier section:

"Unfortunately, Final Cut is not yet capable of real-time editing,
requiring
rendering of all transitions, titles, and graphics, which will limit its
use among
professionals, where time is money."

Taken from the latest issue of Newmedia, page 45, article "Final Cut Pro,"
written
by Jeff Sauer.

Unfortunately, you don't have enough self-worth to actually admit your
mistake..
but no problem. Game over, man..

I just LOVE how you refer to yourself in the third person.. it makes you look like.. well, Sinclap, the village idiot.

Thanks for having the courage to respond to my post. It's just what I expected from you, coward.

Once again...You are in denial..

Don't forget that you had to add the cost of the Mac with the Radius
Video Vision.

For most people, A FireWire G3, Video camera and FCP will get there feet
wet and move on...They could not do this because the other solutions
were cost prohibitive.. Why has Avid dropped prices three times this
year?

> in Canada in April?

Here we go again....That Daily paper stated that iMacs were in short
supply. Did not state that you could not find an imac...Danny 'Chunks'
boy....if your going to have credibility you need to get your facts
straight...

>   Hey, the iBook is good news for us - now, with the help of MagiCMac 6,

> bloated pigware equivalents on the Mac....

Remember, the ibook is a Steve Jobs creation..You know your nemises that
was able to sell 2 million iMacs thus far despite your naysaying about
the imac...

To bad you will not beable to use the wireless airport under

Magicmac...What a waste..

Upset at discovering that, in the grand scheme of things, he was nothing but a zit on the buttocks of progress and he was about to be squeezed, The iDiot Forever Known As Sinclap portrayed his vast ignorance when he wrote:

>This newgroup has died during my absence due to busy work and pleasure
>schedule.

more likely your absence was due to the fact you had your chin caught on your sphincter again.... or you were too busy playing with your sock puppets (especially the one with Pamela Lee's face stapled to it that smells a little funny - better not let Mummy catch you playing with her again...)

>Remember...it's only a computer, a tool...not a religious
>crusade or awakening..

we can agree that TiFKAS himself is a tool...

and as for his self-righteous declarations, it seems rather hypocritical seeing that he continously blindly obeys Steve "the Ayatollah" Jobs no matter how ridiculous his pronouncements from the Reality-Distortion Field�. One can well imagine TiFKAS gladly doling out the Kool-Aid to other drooling Mac fanboys...

> On 9 Jul 1999 04:33:24 G, having been told by the angry husband that was a gun
> in his pocket and he wasn't glad to see him, The iDiot Forever Known As Sinclap

so, he's admitting he's a mutant - comes from years of Sinclair inbreeding..

>   ah, but I (not your imaginary friend "Chunks") do have some legacy in the

> Atari world. I'm on at least two of the available Atari CD-ROMs, and a number of
> my articles for Atari Computing are on the new Renegade Evolution #1 CD-ROM. So
> I'm taken seriously by my peers, unlike you, Internet "Kook" of the Month.

>Wow...I did not know that Atari offered cd devices....

funny, since I told you about CD-ROM support for Atari devices over three years ago. Proof that TiFKAS either is too dense to read everything, or is deliberately ignoring the facts about Ataris in his one-man disinformation crusade against anything with a Fuji on it (and is dismally failing)...

Since then, a number of technical breakthroughs from dedicated Atari programmers have expanded the capabilities of CD-ROM, including adapting IDE CD-ROMs to older STs to burning your own CDs and doing backups to writable CD-ROMs. Indeed, it must be sticking in TiFKAS' craw that an "obsolete" Atari ST can produce CDs, let's see him try that with a Mac Plus...

BTW, I'm currently enjoying the benefits of a brand-new Toshiba 40x SCSI drive on my system - part of my improved financial situation.

>Anything lately? How about the Be platform?

seeing as Be isn't producing an updated OS to take advantage of the new G3s (due to Jobs' fear of a superior OS showing up the bloated Mac OS), I can't see what TiFKAS is crowing about.

Oh, yes, we've had Linux for a few years now...

>
>   in Canada you would be serving hard time for those crimes. Millhaven or the
> Don Jail would be the perfect places for you to start contemplating reality.

>I am not in CA..

but if you were, you would be serving hard time. And, FYI, if you pulled a similar stunt in the country where Nick Leeson committed his fraud (Singapore), you wouldn't be living in a country club enviroment, indeed, you'd probably start your sentence by being caned....

>Whats with the migration down here? The economy nosedived
>in the state?

obviously you flunked political science if you don't know that we have provinces in Canada, not states. And the Ontario economy is doing finely, thank you - we're the leading province in new job creation.

>At least something is going right up north. I bought 100 shares of
>Corel Corp last month for under $4 a share. Less than a month later
>closed at $5.50 today..A nice return thus far..

yup, Corel has been doing well, due to their master-stroke of embracing the growing Linux community and providing some superior applications for them, like WordPerfect 8 - over 1 million downloads from ther web site - and their announcement of offering a consumer-friendly Linux installment for home-desktop use for this fall. Interestingly, seeing as all Apple development has been placed on the back burner...

BTW, those nice people at Caldera gave me a free copy of their OpenLinux 2.2 CD during my visit to Comdex, so it looks like I might find a cheap PC to try it out to fool around with. The Linux area of Comdex has expanded greatly - ten times the size of their area last year. Interestingly, Apple themselves were nowhere to be seen - perhaps they're scared?

>Also 487,000 iMacs shipped in the quarter...So much for the Mujahideen
>Chunks iMac doom and gloom...

still living under the delusion that your imaginary "Atari Jihads" and your equally imaginary friend "Chunks" exist? Perhaps another trip to Bellevue, and stronger voltage, should cure you your malady..

Yup, 487,000 iMacs shipped, but notice that it doesn't mean that they've found consumer homes, just that Apple is using CompUSA and Sears as auxillary warehousing - one of the reasons why Best Buy pulled the plug. As TiFKAS should have learned from his stupid mistake regarding trusting news stories from the Daily Tubby, empty Apple warehouses do not equate to consumer sales - and why I was easily able to find the "Unattainable" YUCKs as well as numerous Rev. Bs at a number of shops across Toronto throughout the entire month of April...

And if you're going to post stuff from the Apple quarterly, TiFKAS, you should also mention that the report also notes that B&W and PowerBook sales are significantly tanking compared to the previous quarter. Expect Jobs to announce a further fire-sale reduction of B&Ws at MacWorld this week...

>
>   sorry, TiFKAS, but that's inadmissable evidence. For the very reason that

> EVIDENCE THAT IT IS YOU THAT IS BEING TALKED ABOUT IN THE ARTICLE. Unless you
> are either Rodney Lane (the author of the piece), or in a desperate measure are
> attempting a la Single White Female to take on someone else's personna.

>Thats not my problem is it?

Sure it is. Inadmissable Evidence. No proof that it's you.

>   Note, too, that the posting that you have made I cannot call up under
> either NEWsie or CAB 2.7 - not because my Internet clients or ISP are
> "inferior" as you claim (Internet Direct, my ISP, is one of the biggest and
> most well-respected ISPs in Canada), but for the simple fact that the document
> IS NOWHERE ON THE SERVER YOU CLAIM IT IS. But then, this is the same amount of

> kack we expect from someone who claims one needs a new web browser when they get a 404 message from another ISP...

>Your ISP is serious _ucked if you can't get on theimac.com/

"PETER! DID YOU SAY THE "_" WORD!? MUMMY WILL HAVE TO CLEAN THOSE FILTHY WORDS OUT OF YOUR MOUTH!"

(picture TiFKAS' mummy in the bathroom with TiFKAS in a headlock, washing out his mouth with carbolic soap).

BTW, TiFKAS - Internet Direct is the host ISP to TUCOWS, a site which requires a lot of room and power. Care to remove your foot from your mouth?

>I can log on all the time using NS and IE.

funny, I can also log onto theimac.com utilizing CAB 2.7 - but nowhere can I find your alleged article (which is moot anyway, seeing as it's Inadmissable Evidence).

> Looks like a you know what issue?

looks like we can add "how ISPs work" to "things TiFKAS doesn't know what the hell he's talking about" (soon to be an exciting new category on Jeopardy!)

>You can email a request to Rodney O' to send a copy...

but that'd be a waste of time, seeing as there is NO PROOF that you are the alleged "Apple Power Rep" he was talking about (if the article even exists)

I'd rather get the proof of your employment from the horse's mouth - i.e., your supervisor at your work. Please post company name, address, supervisor's name and phone number where he can be contacted at work. Failure to do so will only prove what we've all suspected - you're a coward, and a proven Internet "kook" who can dish it out but can't take it...

> It is obvious that you are clutching at straws. It is my belief that you are obviously not employed by any facet of the Apple organization, due not only to your woefully bad spelling as much as the many gaffes you have made regarding even the basic workings of the Macintosh (like claiming that the Mac OS is pre-emptive multitasking when even long-time Mac users admit that it is co-operative, which is a BIG difference), as well as making large uninformed claims like "Microsoft is not afraid of Linux" (which they ARE, ever read the Halloween Documents, chucklehead?)

>Guess Again...

I'm not guessing, Chucklehead - I KNOW.

>Did you know that many politicians and busines folks are 'lozy spilliers'? and quite possibly kan't wreid....?

but that is no excuse for an "Apple Power Rep" - once again, they have standards which they require all their employees - which you would easily fail...

> As critical as I am regarding Apple and their management and policies, they are still a professional organization that require the utmost of courtesy, intelligence and knowledge of anyone employed by them - they are simply not the type of organization that hands out jobs to the first chump that walks in the door. And especially not to noxious little twerps like TiFKAS.

>You will never know...

oh no?

I'd suggest you check out http://www.apple.com - they have a listing of what they expect of their potential employees, as well as a detailed description of how their interview and selection process works. It's very well designed, and there's enough checks and balances there to prevent morons like you from gaining employment to a professional company...

> The fact that you are afraid to hang out in comp.sys.mac.advocacy to help defend your fellow Mac users, but instead choose to post your half-baked, steaming piles of drivel and parrot-sheep press-release postings to this forum that have been thoroughly refuted by professional Mac users like Particle Salad, who you have dealt with by trying to smear his professional reputation (and failed) makes me wonder what your pathology is - and whether you need professional psychiatric help to overcome your obvious inferiority complex.

>This is more fun...Less clutter and entertaining...lots of Star Wars like characters hang out here..-)

spoken like a true CHICKEN.

there are plenty of equally-entertaining characters you could play with in comp.sys.mac.advocacy - the problem is, compared to their expertise, you would quickly be unmasked as the man who had to take remedial basket weaving at your alma matter....

>Pot Kettle Black?

nope - seeing as Milan has been producing 040 clones for a year now. How many Gateway Amigas have been produced in the last year? Zip.

>
>GateWay is bringing out cutting edge stuff not repackaged 68k technology
>that no computer firms are using more. I suppose the TOS Jihads like
>sticking to the past and afraid of new that may bite them..

oh, so you're saying that all 040 Macs are junk?

Again - the new upcoming Milans will support USB - is that cutting edge enough for you?

And at least we know what technology is going into the Milans, unlike Gateway, who despite their pronouncements still won't reveal what sort of hardware and processors are going in them. Smells like vapour - especially the type we smell when TiFKAS makes a pronouncement from his centre of intelligence, located near his buttocks...

>
>The current Amiga's are availble....

but not from Gateway. Three years, and all we have is excuses.

BTW, it's spelled "available". No "Apple Power Rep" job for you!

```
>
>So have you bought a MILAN yet or is it still to high tech for you?

    You know, one of the reasons I bought my Falcon was to spite Roger Sheppard.
I may buy a Milan on my next trip to the UK just to spite TiFKAS...

>Still no ambition...

    and on TiFKAS' part, still no brain.

    And as equally unambitious, seeing as he's too stupid to configure a real
newsreader or post to comp.sys.mac.advocacy...

    well, look at it this way - the Tramiels are IN NO WAY involved with the
development, manufacture or distribution of the Milan. So it's already got a
number of advantages already :)

    BTW, how's the weather holding up in Alberta? Or should we wait a few
minutes :)

In other words, Amiga's own version of Microsoft's J++.

How original....and several years behind.

> Amiga MCC Operating System
>
> One of our convictions is that modern operating
> systems are just one component of the new age in
> computing. The value proposition is no longer just
> the traditional OS, but an overall environment

> providing intelligent power and transparent services for the end user. While the information appliance portion of the Amiga Operating Environment is portable, and will be ported to a number of operating systems by Amiga and Amiga's OEM partners over time, we needed to make an OS foundation decision for the Amiga MCC.

Hmm, no mention of the names of these invisible partners.

> For all of these reasons, we have decided to build the next-generation Amiga MCC platform on top of a Linux OS foundation. We would be remiss in not acknowledging that there are issues to overcome with Linux,

Especially since this has been public knowledge for a long time, and Amiga would look foolish should it try to ignore these problems.

> Graphics, Multimedia and GUI Frameworks
>
> The technology strategy for graphics involves developing key partnerships with companies currently producing state-of-the-art component products. Amiga leverages the development efforts of these organizations to deliver the product capabilities to Amiga customers. For example Amiga is working with ATI to incorporate next-generation 3D rendering technology into the MCC (see the Hardware Architecture section).

Key partnerships, yet they only name ONE company with which they're working?

And they're looking at locking themselves into a proprietary built-in solution (making them dependent on ATI) when everyone else is using AGPs? Foolish.

> The technology strategy for multimedia is essentially analogous to that for graphics. The hardware delivery system for digital multimedia may be a 3D graphics engine, a DVD decoder including MPEG 2 and AC-3 digital surround sound, or broadband Internet.

No specifics? This isn't a tech briefing, it's a kissy-face intro to placate the remaining Amiga owners!

> With regard to windowing environments on the Amiga MCC, we are leveraging a combination of technologies from Linux and Java. At the lowest level (managing the bits on the screen), we are using the latest Linux X Windows window system.

Welcome to loserville. X-Windows. ROFL.

> Pervasive Networking
>
> The near future will bring more high-speed broadband Internet service to homes via cable modems, xDLS and other new technologies. The industry is standardizing on technologies for home networking, giving consumers the ability to connect products throughout the home using standard home wiring and wireless digital high-speed options.
>
> Amiga-enabled products will support these standards

Wow. Supporting standards that everyone else does. How exciting.

> Amiga MCC Hardware Architecture
>
> The Amiga MCC is being designed to support state-of-the-art multimedia while leaving the PC legacy baggage behind. The MCC will have DVD, high-performance 3D, Ethernet-based home networking, digital and traditional analog video and audio, and USB ports for digital peripherals. It will have room for at least 2 hard drives, 2 PCI slots, 7 USB ports and an open drive bay for enthusiast options such as Zip and Jazz drives.

In other words, a relatively modern computer box, much like current G3 boxes -- with the exception that we STILL don't know what chip they're using.

> There is significant momentum for USB (Universal Serial Bus) in the industry. USB is a digital 2-way interface that supports up to 10Mb/s. This allows game controllers to support high-speed interactivity, including features such as force feedback so when you are driving the car the wheel will push back on you. It allows hot detection of devices such as keyboards, printers, scanners, cameras, game controllers, storage devices, etc. In fact, the USB standard supports up to 127 peripherals on a single port. For this reason we do not intend to support the legacy serial, parallel, PS/2 or analog game ports. You can always add USB hubs for more devices, and there are converters to the old buses (e.g. USB to parallel) for your legacy peripherals that you might not want to get rid of for a while. There are even efforts under way to make the next version of USB work up to 100Mb/s.

Wow, a primer on USB. This certainly isn't a tech brief; anyone who knows anything about PCs or Macs built in the last year knows that this technology has already been implemented.

This is just Amiga playing catch-up and teaching ignorant Amiga users about technology they may never have encountered before.

> We have selected a very exciting CPU for the MCC,
> which is at the heart of a next-generation
> processing subsystem.

"But we're not going to tell you what it is."

> Audio / Video: * DVD drive standard (DVD-RAM when available)

It's already available, dumbass. It's just that you don't want to spend $500 for OEM DVD-RAM drives because there are so many cheap Amiga users, they'd choke on their McDLTs if they were asked to pay for a modern system with choice HW like DVD-RAM.

Quite understand that position - but - dontcha know - 'if it don't exist in the USofA - it don't really exist !' (At least that's what we hear from the Excited States)

> but with Motorola in the picture, perhaps we can expect something

"Bengy" ????? Not only have I never met this person, I haven't been to Lethbridge for about 20 years - drove past it once going to Montana when the Dollarette was at par - but that's about it !

Homa Systems is in Ontario - is it not - I try to deal only with local dealers - had too much bad luck with 'aliens' like Toad over the years.

True, m'dear Dan - but - I'll still not hold my breath. After my recent 'Apple experience' (which ended with Apple Canada replacing the machine) I'd love a stable TOS platform - but ????????

>   BTW, how's the weather holding up in Alberta? Or should we wait

Coldest, wettest July on record ever - at the moment sunny and 18C (going to 25 - ????) - but yes - wait a minute, it'll likely change.

You are a silly, childish moron.. are you SO lacking in a life that you choose to engage in debate over platforms you have no interest in or knowledge of?

Sinclap.. don't you have something positive to contribute to the world? Is all the time you spend doing this really making up for your lack of self-confidence? Does it really help you feel better?

Only a child would build up his self-confidence by denigrating the choices of others.

Think again? Well, that would be one more 'think' then you're evidently capable of.

Exactly WHAT above displays ANY of your knowledge of the video market? Are you REALLY stupid enough to believe that FCP has direct impact on AVID pricing? Do you know there are at LEAST 4 manufacturers who have sold more video eding software then Apple? AT LEAST.. yet you still think AVID sees FCP as a threat to their business.

Now, you might argue that there is a potential LONG TERM threat to AVID's business.. but there is no direct threat. By repeating the same thing over and over you prove your lack of understanding of the video business.

Give it up.. remember, it's better to be though of as a fool then to open your mouth and remove all doubt. Talk about what you KNOW.

I have absolutely no real knowlege of the Avid market other than some of their customers are quite dissapointed to have to leave the mac...

That said Final Cut Pro is drop dead wonderful software. It is probably the strongst version 1.0 product I have ever seen. Though Apple says it compliments Premiere and After Effects I relly have to say I feel it makes Primere out gunned and out classed by miles. Afer Effects?? well FCP can do all of Primere's time line editing and do it twice as well, but after effects it can only do half of... FCP has some really nice Compiositing features and can do blue screening as well as running AE filters and plug in's. I think that by version 2.0 of FCP Adobe's Video product line could really be introuble on the mac side.

Anyway the only real weakness with final cut pro are the messages apple sends out about support. It runs on a much wider variety of Hardware than apple lets on and should be certified with many diffrent capture cards. It is actually killer software. And if it could be intigrated with more broadcast systems than just what firewire allows it would take a big chunck of the market. I can't tell you how much I like Final Cut Pro.

> crusade against anything with a Fuji on it (and is dismally failing)...

Let me remind Sinplop that the Atari CDAR CD-ROM drive was the FIRST EVER
commercially available CD_ROM drive!! ie...ATARI STARTED THE WHOLE THING!

It never took off under Atari but boy did the masses flock to the new
technology like wasps to the rotting carcasse...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> be new period...What do you not understand?

I understand everything. It is YOU who do not understand that WE Atari users would rather go to an 060 powered Milan than an Amiga, because we like the Atari OS's and apps more than Amiga or other platforms. It is like you consider that to be a criminal offence! Also, a 68060 at a clock rate of 80 odd MHz is comparable to about a 250MHz Pentium or say a 200MHz PPC 603e. Many people still are happy using older PowerMacs and Pentiums. Atari software, in particular, seems to make better use of the available CPU grunt than Mac/PC software. I doubt you have seen much in the way of Atari software run on Atari machines Mr Sinclair-Day, but could you imagine software that is usable on 8MHz 68000 or 16/32MHz 68030 being run on a superscalar 68060 at 80MHz? It would fly in comparison. THATS why I'd rather have a Milan060 than a new Amiga! I've never owned or used much in the way of Amiga so why should I start now?

> Why would a person with a half a brain would opt for a TOS bucket when
> there is new exciting competeting line comming out?

What is the new Amiga competing with? NOTHING!! The new Amiga is a quick new upgrade path for Amigans who until recently have only had a few add-on 060/PPC cards to give their machines that extra 'pep'...and I'm sure I have more than half a brain thanks kindly...you silly little piece of football players toe-jam you...

> Also, there is not enough TOS Jihads out there to adequately support the
> Milan...

50 a month in sales of Milan. For a small company thats pretty good! Get it right monkey boy!! That will accelerate when Milan060 is out...

> "Although there are more Microsoft Windows users
> than Macintosh users, we would like to remind you
> that there are far more cockroaches than people."
> -----------The-New-York-Times---------------------

Cockroaches are highly adaptable, successful creatures, whose ability to survive is second to none...unlike PC and Mac buyers who are just sheep playing 'duh, lets follow that one and see what it does...'...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

I posted a while back that a NAVAIR Captain has ordered no further
Apple purchases for use within the NAWCWDPS. There was of course a
loop hole that allowed die hards with certain requirements to justify
an Apple purchase if necessary. A justification must of been submitted
before the purchase, and purchases made only after approval. I had to
laugh my ass off yesterday when I found out that these responsible DOD

Apple users had been abusing the order, and caused both of our U.S.
Government credit card holders to have their cards yanked! I mean flat
out yanked, even the ability to complete obligations already made for
items other than computer purchases. This also includes any repairs
that the four failed new G3's needed:). This is going to be great
watching them work this out.
Talk about Jahids.

Mikey

:
: So it's not out yet here in NA yet. Isn't this like calling GateWay's
: Pot Kettle Black?

Gateway's products are nowehere to be seen. Everything doesn't revolve
around America.

: GateWay is bringing out cutting edge stuff not repackaged 68k technology
: that no computer firms are using more. I suppose the TOS Jihads like

: sticking to the past and afraid of new that may bite them..

Not using anymore? Mind you, even the oh-so-modern Mac still emulates the
68k processor. 68k-machines are built all over the world. Not only Atari
clones in Germany, France and Switzerland, but also Amiga clones in
Germany, Poland and the UK.

: The current Amiga's are availble....

So are the current Milans and Hades.
Besides, the current Amigas are 68-based, just like the Milan.

: So have you bought a MILAN yet or is it still to high tech for you?

It is too expensive to me. So is the Mac.

:   it. In fact, one Amiga use said it was comparable to dropping a nuclear
:   bomb... ;-(

Indeed. It should be noted, though, that the end user agreement for the

Amiga forbids any development of nuclear bombs using Amiga technology. =) While the Atari has already trodden the part of using a UNIX kernel (MiNT), and MacOS is to do the same (NeXT(MacOS X), I'm not happy at all about the change of kernel on the Amiga. The Amigas kernel (exec) is extremely compact, written entirely in assembler and holds much of the responsibility for the speedy multitasking of the AmigaOS. The Linux kernel is quite the opposite, very much monolithic, written in C and using another MT approach. I don't look forward to this at all. Mind you, I'm not looking forward to the next gen Amiga in genmeral, either.

Apple will sell all units manufactured. $1599 is a fair market value
pricing for a high quality notebook.

> Then I calmed down and thought about it a bit. If any of the recent

Apple will sell all at $1599 regardless of supply...

Don't count on it. Apple has had a steady price of $1199 for the imacs
in the last 6 months. This is true with the G3 B/W's. Apple will most
likely boost the clock speed and maintain a $1599 price.

> If March rolls around and the iBook _still_ is priced at $1,599, then

I doubt Apple will low ball with a high quality product. Look at the
other product line for pricing history...

Don't bet on a price reduction. Apple keeps a hald days worth of
inventory and can put a break on manufacturing if demand slackens. Most
likely a promo instead of a price cut.

Do you really believe that?. Unlike a certain group of computer users I could mention, the general Amiga population is very knowledgeable where new products/technology is concerned.

Sounds like a case of sour grapes to me.

In any case, why would you care?. The 68k line is a dead horse that Milan and Hades are still flogging.

The new Amiga is intended to gain users whereas the Atari clones are designed to maintain users... and that is the difference.

As always... IMO :-)

It's impossible to trust the opinion of someone who continually demonstrates a lack of understanding in where their scope of knowledge begins and ends.

You continually ramble on about things I've proven you don't understand, like desktop audio and video.

Learn two things TIFKAS:

1. Understand how important it is to be aware of what you don't know..
2. Have humility.. no matter how smart you are, there's always someone smarter. No matter how much you think you know, there's always someone who knows a LOT more.

-Mark

Not completely true. The Phoenix will be a completely different
machine, but retain the ability execute TOS applications. If Centek
can produce this machine, it will be the choice for a superior home
work station. I surely wouldn't spend any money on HPs or SGIs from
what I have seen at work. A DEC Alpha running NT native, now that
might be tempting. The Phoenix with be the "band in a box" machine for
any computer user that has always wished his computer could do
some function that others could do, but they cannot because of some
limitation in hardware or software.
I don't know the facts of the planed Amiga O/S, but if indeed it is
Unix based, will the machines still be about to operate older versions
of Amiga O/S and remain compatible with applications such as Light
Wave 3D, Shapeshifter and hardware?

Hi Clockmeister. Hmm, I dunno - dual 68060 CPU's, while still in the 68K range, doesn't exactly sound like "maintaining" to me...nor does a PowerPC chip running at 266mhz with 256 megs of Ram!

BTW, I hear that Amiga users are not exactly happy with Gateways decision to ditch the Amiga kernel in favor of a Linux based one.

Whats your humble opinion? <grin>

See ya later...

That's cool. I hope it is successfull, if and when it becomes available.

Amiga have suggested that there will be some form of backwards
compatibility of OS3.x, but as always that remains to be seen. Amiga change
plans as often as they change their underwear it seems.
No doubt the UAE will be ported, and the availability of a hardware
solution for disk operation compatability (for those that need it) is in
the works.

Not holding my breath, but at the same time slamming a platform before it
is released is a little unfair, hence my original reply.

Power PC is old hat as far as classic Amiga users are concerned, and
certainly hasn't increased the user base by much (if at all).
How many non-Atarians will buy the new clones based on the specs?.

>
>   BTW, I hear that Amiga users are not exactly happy with Gateways

I am humbled...

The Amiga kernel was dumped some time ago because the work involved in
bringing it inline with Amigas vision of what the new platform should be
was too great.
QNX was the choice, but that too was dumped despite QNX having nearly
finished the OS. QNX are releasing the OS for the NG AND classic regardless
so competition is already there for when the new Amiga arrives.
Initially, that was what pissed Amigans off so much, having been promised
QNX and then Amiga changing tact again.
The Linux decision is not all bad though, as most Amigans have since
realised.
The growing number of apps, developers and users is a good thing to tap
into. If the AmigaOS (which is supposedly to be released as multiplatform)
provides a decent GUI for Linux users (sadly lacking so far IMO), coupled
with a processor base optimised for Linux, the new machine is likely to be
quite successfull.

AmigaOS for Atari anyone? :-)

Is it a real Amiga I hear you ask?.

I'll reserve that judgement until I have used one.

I have FAR more knowledge about the video market then you have even dreampt of having. It's not that complex, however, and with a little humility and intelligence you could easily learn the same thing.

I have NO knowledge about "consumer retail marketing," and I don't get into arguments with those who do. That's where you and I differ greatly.. you have continually gotten yourself in debates that you couldn't handle. With me, specifically, in both audio and video.

If your attempt at speaking as an authority on "consumer retail marketing" is anything like your attempt to speak as an authority on audio and video markets, then you have no credibility. Credibility and trust is built by admitting where your knowledge begins and ends, Sinclap.. and you apparently know no bounds to your
own knowledge. Shame, really..

Your baseless rants on video and audio have done both you and apple a disservice.. you were so off base on both counts that you have lost all credibility in other areas, like "consumer retail marketing" (which I suspect, is your euphemism for being a salesman, not the same thing).

> > You continually ramble on about things I've proven you don't understand, like
> > desktop audio and video.
>

> What does that have to do with the iBook?

Nothing.. it has to do with your credibility.

> You have proven nothing on video...what do you not understand?

You have stated that Avid is "shaking in their boots" about FCP.. but ask ANYONE who does video about this, and they will say this is an extremely laughable thing to say, and demonstrates a COMPLETE lack of knowledge of the entire pro video marketplace. COMPLETE. All you have to base it on is Avid's price cuts.. which, if you did a little research, you would find are not uncommon. As a matter of fact, any "consumer marketing" expert knows that technology always comes down in price.

I haven't "proven" it because it isn't possible for me to prove to you. In order to understand, you'll actually need to do some research yourself.. of course, I'm not holding my breath... that would require humility and honesty, two things that are lacking from at least your internet presence, if not your personality.

> Whats your point? You have not convinced me with your video denial...

Of course I haven't. Do the research yourself, I'm sure that someone who is involved in "marketing" would have access to it. Or ask those in the video industry about it..

To put it clearer for you: FCP is selling mainly to people who used Premiere or some other sub $1g software front end.. it is NOT making anyone I know dump their Xpress or Media Composers.

If you do indeed work for Apple, and someone from Apple is reading this, I would hope they might find a more effective way to "market" their products then to have someone as arrogant and ill-informed as you represent them.

No, not really. I would like to see the machine expand the user base,
even if only a few thousand. It means more software for the TOS
compatible I already have and am happy with. Unlike you and your penis.

At least I am glad I
don't own one of these G3's that are delivered from the factory
non-functional.

>AmigaOS for Atari anyone? :-)

:). I just aquired an Amiga 2000. It has a video toaster, two time
base correction cards, network card, SCSI card and a CSR 040 card.
First impression was it runs about the speed of my Afterburner. Takes
forever to boot. I really don't know much at all about Amiga, but I
wouldn't trade MiNT/N-AES/Thing for what I saw any day. It does seem
to multitask smoother than my Atari setup however. It's just different
I guess, but the windowing (Workbench?) seems a nightmare (to me:).
It's going to take me a year just to figure out how to use the
Toaster:).

IMHO:)

Really?. I don't think so. There is a reason Amigas went to PPC, be it
060/PPC combinations.

 Many people still are happy using older PowerMacs and

That is a good point. I wouldn't expect you to start using one now. Having
said that, if a new Atari came out and it was the hottest thing going I
would consider buying it, regardless of the brandname.

> > Why would a person with a half a brain would opt for a TOS bucket when

> What is the new Amiga competing with? NOTHING!!

Millions of other Linux users, Windows users and Mac losers. That is who.
And no, new Atari clones aren't competing with the same crowd, they are
competing (?) on the same level as Amiga classic and Acorn users are, if
competing is the word to use.

 The new Amiga is a
> quick new upgrade path for Amigans who until recently have only had
> a few add-on 060/PPC cards to give their machines that extra 'pep'...

extra 'pep' ?. That is an understatement. Do you really think that an
'060/PPC upgrade isn't as good as one for an Atari clone?. What about the
G3/G4 cards?.
Maybe the fact that big box Amigas have had a CPU slot for exactly that
reason, ie CPU upgrades, somehow means that the effect on performance of
the machine isn't as great. Explain this.

and

There is something wrong with this analogy. Aren't PC's highly adaptable
AND successfull?.

On first impressions Linux is a nightmare OS too, but with a little familiarity the advantages become apparant.
I suggest you give AmigaOS a chance.
Which version of the OS has your 2000 got?.

BTW there are many workbench enhancements available on Aminet, be sure to check them out ;-)

Regards,

Clockmeister.

More software with a few thousand sold...unlikely to happen according to
Chunck's own words that only 50 Milan's are only being shipped monthly
or 600 a year...Hardly thousands...

My penis is fine...No complaint from the penis recepient dept...-)

Correct.. but of course, any conclusion drawn at this point will be pure
conjecture..
something you appear to be quite good at.

> He is also in denial as well...He will realize it when the threat sneaks
> up on him...

What am I in denial about? That I will use my AVID, that I will use FCP when it's ready, that I don't care what platform I use. Where's the denial, MacWacko?

It would be nice if you had the courage and the intelligence to actually discuss this instead of posting silly childish one liners. I don't blame you, though, because you don't know what you're talking about, and each time you post that becomes more and more clear.

I don't know if you gentleman have noticed, but it seems the MacWacko has stopped responding to my posts directly. I'm not surprised, as he doesn't know a thing about the industry.

The most amazing thing, to me, is how someone can try and discuss something they so OBVIOUSLY know very little about. You can usually bluff yourself through it for a couple of minutes, but then it becomes increasingly clear how little you know (I know this from experience.. it's now I got into this business so many years ago).   :)

It is wise for him to stop discussing details, but unfortunately it's a little too late. He already has opened his mouth and removed all doubt..

It seems to me that you have as much "religious fervor" about your Macs as they have about their Ataris.

You are no different.. except a lot less fun.

I think the clincher was the fact that he had also been threatening some
people in e-mail as well - indeed, he once e-mailed me and literally told me to
shut up and never to dare contradict him again, or he promised that there would
be trouble. Of course, it strenghtened my resolve to further butt heads with
him. In any case, the NZ government people agreed , after surveilling his
activities for a week after I tipped them off, that he was definitely in
violation of any user agreement he may have had with them.

actually I was referring to TiFKAS' puny attempts to try to preach to the
converted in this forum - and his puny laughable attempts to impress us with his
alleged "Apple Power Rep" job, his alleged bimbos, his alleged nice car, his
alleged laptop. Really if he had ANY AMBITION, he should be posting his drivel
to the PC forums, as those are the ones he should be trying to derive market
share from. Alas, he's as inept with them as he is with us - I saw him trying to
debate PC users with his usual tactics and drivel on a pro PC/anti-Mac web site
and well, it was like watching raw meat being thrown to starving lions :)

unfortunately, when a REAL debate comes up, Mr. Ventura acts like a big
baby or runs away. He's STILL too yellow to come to Ontario and debate with our
fisheries minister over why Minnesotans have to follow the same rules like
anyone else when they come to Ontario and have a catch limit...

TiFKAS = The iDiot Forever Known As Sinclap , called that because:

a) he's an idiot, and

```
    b) he'll always be known as Sinclap.

    And as usual, his imaginary friend "Chunks" has not now or ever existed..

Be more specific if you can. I suspect you cannot. The above statement is so general
and silly as to make further discussion pointless.

You obviously know nothing about the video market, apple-cheerleader MacParroting
notwithstanding..

AVID didn't become the editiors of choice of major film studios by being buggy.. movie
studios can afford to buy ANYTHING, and they buy AVID. No they aren't perfect, but over
the years they are QUITE good. I can honestly say I've NEVER had a crash that caused
loss of data with my AVID.

AVID is several generations old.. they have learned from their mistakes, and have
created an excellent product.

Did you read the recent Macworld review of FCP? In case you missed it, they didn't
think it was worth buying if you were a current Premiere/After Effects user.. and forget
about AVID. They obviously had a reviewer who knew better then to compare it with an
AVID.

Moron, I'm not afraid of any format, because I use anything that works.. including FCP, when it works better then what I have.

I don't see your name mentioned here.. or did I miss something? Are you the
unnamed
apple mystery rep?

I wish that too - because, like Milken, you would have wound up with your ass in jail... :)

BTW, just so TiFKAS knows, Nick Leeson is the guy who lost �1 Billion in the Bank Of England in a stock-market swindle - and also wound up with his tush incarcerated...

Glad to see that TiFKAS has the desire to go to jail - maybe hard time might give him a strong dose of reality.... :)

I reckon it looks like one of those cute little hand-soap
dispensers you find in posh toilets in hotels. Those have
been around for years so maybe there is some copyright for
Macintoss to explain there?

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Yes! I'd better warn customs officers here in New Zealand that
if ever Sinplop visits he should only be allowed entry under
full supervision while on NZ soil. We cannot risk contaminated
sheep!! Especially if they are going to start bleating,

'M-a-a-a-a-a-cin-to-o-o-shhh!!'

Euuurghh!!

I recently bought a puzzle for $15. I'm not much one for puzzles, but this type I like....

It is a Atari TT, and this is what I've got so far....

"An Atari TT030 computer that is DEAD, NON-WORKING, INCOMPLETE, being sold FOR PARTS. Is missing keyboard, floppy drive, TOS ROMs, Hard Drive, Hard Drive Mount/shell, and a few other chips/components. Also does NOT inlcude any cords, mouse, or other cables. *Does include* the 68030 processor, power supply, VME cage, all connectors on back including the VME cover plate with two serial ports mounted on it. While there may be a chance that this computer could be fixed, I am selling it as a PARTS MACHINE ONLY."

Alright, the way I see it, the parts list is looking like this:

Missing list:

keyboard - I have a Mega ST keyboard. Would this be compatible?
floppy drive - No problem.. common.
TOS ROMs - Possible problem... anyone know of anyone who burns these?
Hard Drive - no problem.. common.. though the cables from the motherboard to the hard drive might be a problem.
Hard Drive Mount/shell - One could be fashioned to fit... might be challenging.
and a few other chips/components - again, possible problem, since more than likely these chips taken were probably rare. Anyone deal in ST/TT components?

cords - From computer to monitor/hard drive.. little problem
mouse - absolutely no problem.
other cables - "other" cables? Internal? Possible problem.

As for what's included... "68030 processor, power supply, VME cage, all connectors on back including the VME cover plate with two serial ports mounted on it. "

I'm relieved that the processor is there, and power supply... my only question is how good the motherboard and power supply is.

So these are the parts of the puzzle. I'm curious to sources for TT computer components, and where I can find specs so I can know what other parts I need to look for.

Thank folks for your helpon this savenger hunt!

Doctor Clu

Company Press Release

SOURCE: BancBoston Robertson Stephens

BancBoston Robertson Stephens Upgrades AAPL to a Buy Rating

SAN FRANCISCO, July 8 /PRNewswire/ -- The following is being issued by BancBoston Robertson Stephens, a member of the National Association of Securities Dealers, CRD number 41271:

BancBoston Robertson Stephens computer systems analyst Alex X. Mou today upgraded Apple Computer (Nasdaq: AAPL - news) to a Buy rating from a Long-Term Attractive. Apple Computer is a leading PC vendor and one of the most recognized franchise brand names in consumer-computer market.

``We are upgrading Apple to a Buy rating from a Long-Term Attractive,'' said Mou. ``We believe Apple is well positioned for the September quarter, with a strong-product lineup following a solid June quarter. We expect that the software portfolio will provide upside to earnings and margins with the release of Sonata in the fall and Mac OS X early next year.

``We are raising our estimates from $2.75 to $2.80 and from $2.86 to $3.00 for fiscal 1999 and fiscal 2000, respectively,'' said Mou. ``In addition, we have established a 12-month price target of $75.''

Clients interested in receiving more information should contact their salesperson at 415-781-9700.

BancBoston Robertson Stephens is a leading international investment banking firm focused on growth companies. The firm's 55 equity and high yield research analysts cover more than 600 companies. Additional information is available upon request.

Teaching CompUSA sales staff about Apple and the Mac
6/30 - Rodney O. Lain

If you agree with everything that I say, then you're not thinking.

--I once heard someone say this

A few weeks ago, I reported CompUSA's new initiative to educate its sales staff on things Macintosh. Last week, I mentioned that my boss at CompUSA asked me to help lead the Mac classes. Well, this week we completed that training, and I must say that I am actually becoming more optimistic about CompUSA as a national Apple Macintosh presence.

Here's the gist of what happened:

We had two classes -- the Tuesday night session for half of the sales staff and Thursday night for the second half of sales guys. The first night was more of a lecture and a hands-on with the store's demo Macs.

Tuesday night

The Apple rep conducted the first half of the meeting. He outlined the Mac market in the Twin Cities; I was pleasantly surprised to find out that the Twin Cities is the fourth-largest market for Macintosh sales, given the heavy concentration of publishing houses and creative-content professionals. He also gave a breakdown of the Minnesota demographics; i.e., he described the typical Mac user.

Then it was my turn.

Maybe I'm becoming a more mature Mac bigot, but I had no urge to describe the Mac as the world's greatest computer (even though it is). My approach was more of an appeal to their logic. I explained the statistics supporting the fact that the iMac is the best-selling computer since its introduction. I gave the anecdotal example of a customer whom I had met. She said that she'd been in the store earlier that week and a sales person talked her out of buying a Mac. I told the group that that woman had bought no computer, when in fact, she had come there specifically to buy a Mac. The store lost money due to some idiot sales person's dislike of the Mac.

"Hey, I sell Packard Bells, if that is what the customer wants," I told them, "even though I hate Packard Bell computers. You should have the same approach towards the Mac. The sales person's computer preference should have no bearing on the customers needs and wants."

I stressed the fact that the Mac is no different than any other computer, in terms of sales: it has peripherals; it has software. I explained that Mac users buy a disproportionate percentage of software, peripherals, etc., considering the Mac's small market share.

I explained that the Mac OS is the #2 consumer OS in the world, a fact that people consistently overlook. I explained that the iMac single-handedly made USB an (emerging) standard.

After my presentation, the staff was shown a video on the Mac OS. After that, the Apple Rep and I led a tour of the Apple section and demonstrated the features of the iMac.

As the Apple Rep talked, I pulled aside one of the sales people and asked, "how long does it take to network two PCs?" Then I asked that he time me as I network the display iMac and my PowerBook G3. I clocked out at 2 minutes, 47 seconds. When there was a lull in conversation, I told the group what I'd just done.

"He actually did it in just 2 minutes," my "timer" noted, "it took him 47 seconds to remember his password."

Several of the sales guys asked questions afterwards and expressed more than just a passing interest in the Mac.

There was actual interest.

Thursday night

On Wednesday night, I caught a brainstorm. I was playing around with my PowerBook and noticed that I had Microsoft PowerPoint (which I'd been meaning to learn). I thought it would be a great idea to put together a slideshow presentation. So, one hour later, I'd put together something to present Thursday night. Did I mention that I'd never created a PowerPoint presentation before?

Anyway, the next night, I got to the store and set up the projector to run off my laptop. I also made sure that when the staff made in, they'd see the OpenGL screen saver that I have recently installed. That gave me a chance to make a nice segue into the fact that SGI's OpenGL API's are the standard for game development, and that it is now a part of OS 8.7 and beyond.

Thursday night's training went well, also.

The aftermath

The results of the training are pretty evident. The sales people spend more time in the Mac section nowadays. They spend time keeping the shelves stocked; there are more people involved in the Mac sales (if we could have more to sell, it would be nice, though).

I also took advantage of the situation.

One of the sales staff mentioned that it's hard to sell Macs, because many of the peripherals, software, and hardware are not in stock, even though we know they all exist. I asked our manager why CompUSA doesn't stock the peripherals that are being sold for the iMac (USB adapters, SuperDisk drives, etc.). I did that for two reasons:

1. I really wanted to know, and
2. that shows the sales staff that it isn't Apple's fault for not having inventory in stock.

A few hundred more complaints/suggestions of this sort, and we'll have Mac peripherals in the store for a change.

A side-point to all of this: on Sunday, two customers came in who turned out to be CompUSA employees. Professing to be big-time Mac users, I asked them if they have any "pull" with Jim Halpin (CompUSA's CEO), for I wanted them to pass on some complaints of mine. It turned out that they are national trainers for CompUSA' larger corporate accounts. We talked for a long time, and I noted that if CompUSA doesn't shape up that iMac sales may go to places like Sears.

Another interesting side-point to all of this is now that I know PowerPoint, I spent the weekend putting on PowerPoint presentations (when sales were slow) -- something I plan to do on a regular basis now. You see, I obtain regular copies of the Apple Sales and Marketing Resource Library. This is a set of three or four CDs chock full of the latest info on Apple products (congratulations to Apple's marketing group. Suggestion: could you make the disc a hybrid CD? You know, for Windows and for Mac? Not all sales have Macs�). For example, this month's CDs consist of complete PowerPoint presentations on the PowerBook G3 Series, Final Cut Pro, QuickTime 4.0, WebObjects "Success Stories"; also included are QuickTime movies of Worldwide Developer's Conference speeches/sessions (the Mac OS 8/8.7 Overview, OS X Overview, for example),

The PowerPoint files are a great help. I set them to run � la a store kiosk. I set them to loop continuously and swapped them out regularly throughout the day. Customers were treated to presentations on Apple products, as well as DVD movies ("Austin Powers" and "A Bug's Life").

All in all, I think that things in our part of the world are doing nicely. If the management in other stores put forth the effort that we did, then the implementation of Mac training at CompUSA will be a smashing success.

--- Rodney O. Lain, rodneyo@macconnect.com.
Rodney O. Lain, a former university English and journalism instructor, works full-time as a software developer and works part-time at a local CompUSA Apple Store Within A Store. A card-carrying member of the local Macintosh User Group Mini'app'les, Rodney writes this column exclusively for theimac.com. His greatest desire is to become an African-American Guy Kawasaki. A self-professed "workaholic

writer," he waxes prolifically about race, religion, and the "right OS"
at "Free Your Mind & Your Behind Will Follow", his unabashedly
pro-Mac website. When he's not cranking out his column, he collects
John Byrne comic books, jogs, and attempts to complete his first novel.
He lives in Eagan, Minnesota, a southern suburb of St. Paul.

    ah, but I (not your imaginary friend "Chunks") do have some legacy in the
Atari world. I'm on at least two of the available Atari CD-ROMs, and a number of
my articles for Atari Computing are on the new Renegade Evolution #1 CD-ROM. So
I'm taken seriously by my peers, unlike you, Internet "Kook" of the Month.

    and again - there are no "Atari Jihads" who are "out to get you". Maybe it's time to increase the your Prozac dosage?

>
>> Glad to see that TiFKAS has the desire to go to jail - maybe hard time
>> might give him a strong dose of reality.... :)

in Canada you would be serving hard time for those crimes. Millhaven or the Don Jail would be the perfect places for you to start contemplating reality.

>>
>> again TiFKAS hallucinates that I'm living on minimum wage - just like he
>> hallucinates that he's an "Apple Power Rep"...
>
>
>
>http://www.theimac.com/news/excl/208.shtml
>

<snip>

sorry, TiFKAS, but that's inadmissable evidence. For the very reason that Particle Salad mentioned when he read it through the first time - THERE IS NO EVIDENCE THAT IT IS YOU THAT IS BEING TALKED ABOUT IN THE ARTICLE. Unless you are either Rodney Lane (the author of the piece), or in a desperate measure are attempting a la Single White Female to take on someone else's personna.

Note, too, that the posting that you have made I cannot call up under either NEWsie or CAB 2.7 - not because my Internet clients or ISP are "inferior" as you claim (Internet Direct, my ISP, is one of the biggest and most well-respected ISPs in Canada), but for the simple fact that the document IS NOWHERE ON THE SERVER YOU CLAIM IT IS. But then, this is the same amount of kack we expect from someone who claims one needs a new web browser when they get a 404 message from another ISP...

It is obvious that you are clutching at straws. It is my belief that you are obviously not employed by any facet of the Apple organization, due not only to your woefully bad spelling as much as the many gaffes you have made regarding even the basic workings of the Macintosh (like claiming that the Mac OS is pre-emptive multitasking when even long-time Mac users admit that it is co-operative, which is a BIG difference), as well as making large uninformed claims like "Microsoft is not afraid of Linux" (which they ARE, ever read the Halloween Documents, chucklehead?)

As critical as I am regarding Apple and their management and policies, they are still a professional organization that require the utmost of courtesy, intelligence and knowledge of anyone employed by them - they are simply not the type of organization that hands out jobs to the first chump that walks in the door. And especially not to noxious little twerps like TiFKAS.

The fact that you are afraid to hang out in comp.sys.mac.advocacy to help defend your fellow Mac users, but instead choose to post your half-baked, steaming piles of drivel and parrot-sheep press-release postings to this forum that have been thoroughly refuted by professional Mac users like Particle Salad, who you have dealt with by trying to smear his professional reputation (and failed) makes me wonder what your pathology is - and whether you need professional psychiatric help to overcome your obvious inferiority complex.

As I said before - unless you are willing to reveal who is employing you, complete with company name and address, telephone number and name of supervisor to confirm, your claims of being an "Apple Power Rep" will continue to be considered to be just another part of your multi-faceted "kook" personna - as in TOTALLY UNBELIEVABLE. For once, COWARD, try to show some IRREFUTABLE EVIDENCE that you are who you claim. Or are you trying to be the next Earl Curley?

>"Whats on your PowerBook?"
>   -Sinclap to Susan A.(Fellow colleague)

again, no evidence that he has a fellow colleague - or, for that matter, that any woman would allow him anywhere near 500 feet away from her...

>Sent via Deja.com http://www.deja.com/

known far and wide as the training wheels for the USENET newsreader-clueless...

>Share what you know. Learn what you don't.

TiFKAS again fails on both counts...

Hi there,

Daniel L. Dreibelbis wrote of one Peter Sinclair-Day...
>
>   and again - there are no "Atari Jihads" who are "out to get you". Maybe
> it's time to increase the your Prozac dosage?

He'd better take something with somewhat more 'mule' than Prozac!! Delusions as strong as he experiences tend to come from mind-altering substances that are normally sold on the street!! I'd recommend strychnine, or failing that a really good onion bhajee with extra curry and chili...

The Jihads may not be real but we're out there in other ways!...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Think Again...Avid just dropped prices again by upto half again...Gee I wonder why?

An Open Letter to Avid's Macintosh Customers

We know your business is somewhat dependent on understanding Avid?s future product directions and we have been remiss in communicating our plans that will allow you to better manage your business. During the past few months, it seems that we have succeeded in confusing many of our users about the future of the Avid Media Composer� on the Macintosh. Judging by the emails we have received and commentaries we have seen on various forums, we have also prevailed in making many of you angry in the process. We would like to apologize for that, and once and for all, set the record straight.

I realize that the wealth of NT announcements we made at NAB may have given the impression that our focus was being drawn away from the Macintosh platform. Let me reassure you that this is not the case. We never had any intention of abandoning our Macintosh users -- after all, let us not forget that we built our business on the Macintosh-- but following the blizzard of publicity on our new NT releases, we now understand that is exactly the impression that we managed to create.

Many of our customers are demanding solutions on both Macintosh and Windows NT platforms. To meet that customer demand, we absolutely needed to develop NT based solutions. But at the same time, we also worked hard to make these solutions compatible with our Macintosh-based products so that no one would feel that they were being forced in one direction or another. During this time we have never ceased to develop on the Macintosh.

At NAB this year, we introduced uncompressed video and a host of editing improvements to the platforms. As a matter of fact, I think it would be fair to say that it was one of the most significant product announcements in our history. Today we have one of the most comprehensive Macintosh offering of media products in the industry (which includes Avid Film Composer�, Avid Media Composer�, Avid Xpress(tm), Avid storage, Avid Unity MediaNet(tm)a, Avid MediaShare(tm) Fibre Channel, Avid Cinema�, Digidesign ProTools�, Softimage|Elastic Reality� and Digidesign Audio Vision�.)

So where are we going with our Macintosh-based solution? The best place to begin is with a clear description of what we are and are not doing on the Macintosh.

Here's what you can expect on the Macintosh:

Promotional price reductions: We have heard from many of you that the price we established was simply too high for many to afford and we are responding to it. First, we are reducing prices of new system purchases by as much as 50 percent for customers who wish to remain on the ABVB platform. Secondly, we are reducing the price of upgrades with the introduction of a discount of up to 28 percent. This means that any customer owning a PCI-based Media Composer ABVB system can upgrade to Media Composer XL Version 8.0 for Macintosh with a Meridien board for just $17,995 [USMSRP]. Prices are for boards, kit and software only and this special promotion runs from July 21 - September 15, 1999.

New "Millennium Edition" Release for Avid Media Composer�: We are now working on the next release of Avid Media Composer for the Macintosh. Called the Millennium Edition, this upcoming release is planned for mid-2000 and will include the following enhancements: support for the upcoming G4 platform, additional AVX plug-ins, and Pan & Scan for video images.

New model of Avid Xpress: We are also bringing our Meridien(tm) video subsystem to Avid Xpress for Macintosh, providing the next generation of video quality, uncompressed images and media compatibility with Avid's Meridien-based products on Windows NT. This will be made available as an upgrade in September 1999.

Customer Choice Program: For those who remain uncertain about whether they can safely invest in additional Macintosh systems, we are offering a new program designed to take any perceived risk out of the choice. Any owner of a Macintosh-based Media Composer XL system will be given the option to convert to the equivalent NT-based Media Composer XL system for only $12,000 [USMSRP] within twelve months of purchase.

New Avid Macintosh Development Group: We have created a dedicated group within Avid to develop additional features for the Macintosh-based applications. We will work with Apple to optimize the capabilities of the platform and maintain a close dialog with our Macintosh user base to be sure that we are supporting your needs. Although much of the work done at Avid applies to all of the platforms that we operate on, we believe that, at this juncture in our history, it will be helpful to have a group of people whose sole mission is to respond to the needs of Macintosh customers.

But now allow me to be equally clear about what we are not intending to do.

We have no intention of bringing our high-end finishing solutions to the Macintosh. Features like multistream uncompressed video, 24 fps feature film editing, universal offline capabilities, advanced color correction, and the graphics capabilities that characterize our Symphony and DS product lines are not currently in our plans for the Macintosh. Our intention is to focus our Macintosh effort on editing capabilities and the features that are most important to the editing task.

We hope you will agree that these steps are responsive to concerns that you and your fellow editors have raised. Our goal will be to provide the best editing system available on the Macintosh for as long as you, our customers, continue to support the product. We will make sure that you can continue to invest in the platform and realize the value that you are seeking from an Avid solution.

Most importantly, we will always try to be candid with you about what we are and are not intending to do on the platform so that you can make decisions that are appropriate to your business. As a first step to openness, we are setting up new email box mac_business@avid.com to allow you to ask questions and express your views.

Finally, let me just say once again that you have our sincere apologies for the confusion and uncertainty we caused on this issue, and our complete commitment to do better in the future.

Sincerely,

Bill Miller
Chairman and CEO
Avid Technology, Inc.

Wow...I did not know that Atari offered cd devices....

Anything lately? How about the Be platform?

> >
> >Hardtime is not prescribed to white collar crime. More like playing

I am not in CA...FYI: Ontario truck drivers need to learn to drive in
the Twin Cities. Have seen lots of Minetoba(sp?) drivers that serious
need a driving lesson here...One did an illegal u-turn next to the local
Starbucks...Whats with the migration down here? The economy nosedived
in the state?

At least something is going right up north. I bought 100 shares of
Corel Corp last month for under $4 a share. Less than a month later
closed at $5.50 today..A nice return thus far..

I expect my Apple shares to go bonkers today due to the strong
earnings...$200 + million with a expected $500 million buy back of
shares from the $3.1 billion cash hoard on hand with only $300 million
in long term debt...Can't argue with the balance sheet.

Also 487,000 iMacs shipped in the quarter...So much for the Mujahideen
Chunks iMac doom and gloom...

>

Your ISP is serious _ucked if you can't get on theimac.com/

I can log on all the time using NS and IE. Looks like a you know what
issue? You can email a request to Rodney O' to send a copy...

Sorry, I'm refering to iMacs of course!!

Some hotel latrines I have seen have these plastic hand-soap
dispensers stuck on the wall. They have a translucent lid on
top that lets you see how much soap is left. It had occurred
to me that they look remarkably like iMacs!! (or vice-versa)

Thats why I wonder if Apple have breached a patent on a soap
dispenser design!!

;^)

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> Wow...I did not know that Atari offered cd devices....

Really? That doesn't surprise me!! Sometimes even I
wonder why I have this costly NEC fast SCSI-2 CD-ROM
drive hanging off the SCSI port on my Falcon. Oh well,
the few Falcon/ST specific software compilation CD's
can still be well complemented by the many royalty
free image/sound/anim disks for use in publishing etc...

> Anything lately? How about the Be platform?

Be seems to have flown into the windscreen of a small
farm truck pottering down the interstate at 30...messy!

The mags no longer give any editing time/space to Be
any more...shame really, Be was starting to look like
a viable alternative to quirky ol', slow ol' Mac OS...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Fellow sportsfans....

Looks like the Amiga will rise from the dead with new hardware and OS software based upon new technology...Read all about it from

http://www.cucug.org/aminew.html

You see, the new Amiga has a chance since GateWay is behind it unlike a little known company that is repackaging old 68K TOS technology with a high price. The Amiga hardware will be new and cutting edge and backed by a real company.

But the typical Atari Mujahideen response will be as usual and in denial..

As usual, TiFKAS is trotting out the same tired old arguments which only prove he doesn't know what the hell he's talking about.

The new Milan (which will hopefully be Atari-badged) features an updated TOS produced by Milan GmBH themselves; indeed, new Milans also feature the latest version of MagiC, 6.1, as its recommended operating system - a true pre-emptive operating system, unlike the co-operative model in the overpriced, overhyped, underpowered iMac (read FLAWED). As for price, it is more competitively priced, which has led to its great success in Europe averaging 50 units per month (the best showing for a TOS clone so far). How many Gateway-produced Amiga clones have been sold in the past year? Zip.

The Amiga hardware will be new and cutting edge and backed
>by a real company.

the notable thing about the press release about the new Amiga is that they are still not revealing what processing chip they are using in it! As well, they have raised the ire of many users and developers by dropping the current operating system in favour of a Linux-based system.

Gateway has had the rights to Amiga technology and the name for three years, and yet the only thing they've produced in those three years is excuses. In that same time, we've seen several Atari clones come out from Milan and Hades.

Please note that the both the Hades and Milans have added to the rock-solid foundation of TOS such things as PCI card slots, IDE drive support, faster processors. Also, the newest Milan will feature USB.

Milan GmBH is a a real company based in Germany- and a company that, if they saw the type of FUD that TiFKAS, a known non-expert and clueless troll with no life, was spreading about them, would gladly respond to him with a major lawsuit.

>But the typical Atari Mujahideen response will be as usual and in
>denial..

grammatical syntax is wrong there.

And as usual, TiFKAS is hallucinating about imaginary "Atari Jihads" who are "out to get him" and the Macintosh. Time for his next trip to Bellevue..

("Don't worry, Mr. Sinclair, after thsi next series of treatments we're sure that you'll never see another one of your imaginary Jihads or your equally imaginary friend Chunks - just let us apply these electrodes to your head, lie back and relax. Ready to start the treatment - CLEAR!")

PS to Amiga users - please feel free to respond to both me and this moron on this question, as I think it would make for a lively debate...

according to an executive at Milan GmBH, the timetable is to release the new Milan in Europe first on January 2000, with a projected North American launch in April 2000.

You'll find the news at http://bengy.atari.org/ali.htm .

Looks good for Amiga fans! The new Amigas should be good for desktop video...which in turn may not be such good news for Mac users! Milan is an upgrade path for Atari users, NOT Amiga or anyone else. TiFKAS has again failed to give us the full picture on the Milan deal!! But then again who are Motorola, the guys supporting Milan?!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

The entry level new Amiga model will be priced in the same ballpark as the new Milan which is using outdated technology. These new Amigas will be new period...What do you not understand?

Why would a person with a half a brain would opt for a TOS bucket when there is new exciting competeting line comming out?

Also, there is not enough TOS Jihads out there to adequately support the Milan...

The soap dispenser is not shaped like an iMac is like the EPOWER is.

So it's not out yet here in NA yet. Isn't this like calling GateWay's
Pot Kettle Black?

GateWay is bringing out cutting edge stuff not repackaged 68k technology
that no computer firms are using more. I suppose the TOS Jihads like
sticking to the past and afraid of new that may bite them..

The current Amiga's are availble....

So have you bought a MILAN yet or is it still to high tech for you?

Are you deaf, Sinclair? Blind? I wonder. We've offered proof positive, time and time again, about all the advances that TOS OS's and hardware have made in the last few years and *still* you act like we are all using TOS v1.0 (from disk) on .5 meg memory 520ST's built in 1985. Get over it son, we have moved on, why can't you?

BTW, I see you gave you usual (inappropriate) response to a user with a legitimate request for Mac-related help. Is this how you deal with you customers as well, being the Mac "power rep" that you are? ;-))))

Oh well, I suppose the situation could be different if you live on New Zeeland
or Canada. Perhaps could Mario set the third button to be a "pure" middle
button in Amiga mode?

>   BTW, I'm using a Mouse Adaptor right now with my Falcon and a Logitech

Drawing tablets, that sounds like a good idea, since I don't think Tabby is
manufactured any more, although the Amiga supports Wacom tablets.

It's a pity I have a vanilla STM, but it sounds like quite a feat, especially
coming from a private person!

That would help a lot, since it sounds like a chore to order from overseas. I
don't suppose one could build these kits by hand?

>   much fairer comparison can be made... ;-)

Many many thousands of primary schools. Much of New Zealand is small rural
centres with schools catering for as few as 10 or 20 pupils...that adds to
a very high number of schools considering the population base...

There is only one main centre (Auckland) with more than 500,000 people. I
live in Christchurch with about 350,000. Wellington is next with around
300,000. Nothing else is bigger than 100,000. Towns with less than 20,000
make it into the top 10...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Hi there,

G3's aren't unreliable!! Once Apple find *good* motherboards and
video cards to install in them they work fine! :)

Might wait awhile for that tho'...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Fact is that Avid dropped prices...Why? You know the answer...Not all
have $25,000....

well, Ken is expecting sometime this week the beta of Mario's new keyboard/mouse adaptor that
will allow for attaching a PC keyboard as well as a serial mouse, so no more mushy keyboards. :)

As well, he's working on a 68030 accelerator board for the ST, and a series of new graphics boards for expanded resolution and colour - first for the TT and MegaSTe, next for the Falcon, and then one for the ST.

There's just no repressing that kid :)

and the fact remains, TiFKAS, that you not only don't know beans about how the video market operates and works, but it's well known the fact you have all the intelligence and personality of a cheese omelette. Particle Salad has done a GREAT job exposing your profound ignorance on the subject.

Besides, what would you prefer to use - the rock-solid operation of a package that is known as an industry standard like Avid is, or a sub-par kludge that has a tendency to self-destruct in the middle of a project like Final Cut (that was recently reported on the Macintouch web site at http://www.macintouch.com)

And speaking of which, for someone who's supposed to be such a hot-shot "Apple Power Rep", howcome some of the biggest complaints about the laughable disaster that the Sears launch of the iMac has become seem to be centred at stores in the Minneapolis area, which I believe happens to be in your territory? (http://www.macintouch.com/imacsears.html)

Ready to surrender, TiFKAS?

>Sent via Deja.com http://www.deja.com/
>Share what you know. Learn what you don't.

hard for TiFKAS to do when his brain can be likened to a collander....

Lets see...A G3/400 with 128MB, 12 G's plus a Apple 21 screen, a copy of
FCP and DV camera will set you back $6 G's...

Do the math...80& of an Avid system for 20% of the cost.

Must of read the wrong notes. First, I do not call on Sears we have
other folks for that. Plus Sears has greatly improved as time
flies...Nice try..

..and this has exactly WHAT to do with my above post, MacWacko?!

LEARN your limitations, and you will look MUCH less stupid here.. if you care, that is. Don't speak about which you don't understand.

I ask again.. have you EVER cut video on an AVID? B&W/FCP? Stop reading the trade magazines, MacWacko, and start thinking for youself.

>
>And you? Have a clue.

why don't you GET a clue, TiFKAS? I see you're dodging the issue as usual. To repeat - Particle Salad is a professional video person familiar with Avid on the Macintosh who knows what he is talking about, while you? A shmuck of the highest order who keeps tilting at windmills with fujis on them while wiggling his prodigious ears in order to try to distract people from the fact he has absolutely no idea what he is talking about...

coming from someone who has proven time and again he can't even add, much less multiply. Again, Particle Salad had proven you wrong. And TiFKAS, instead of facing the facts, keeps on bleating the same old parrot-sheep lines his Uberboss Steve Jobs feeds him...

and again, dodging the issue - what use does a professional need with a kludge like Final Cut when it keeps on self-destructing in the middle of the project? Even Apple is admitting they goofed. Go back and read the article again...

>

>flies...Nice try..

try "bullseye". I suggest you read the Macintouch web page (a web page that is honest with Mac users about the issues about the product and not prone to kissing Jobs' ass like certain "Apple Power Reps" with no life) and see just what is going on - bad placement, little stock or peripherals, $100 over the MSRP, bad-mouthing by Sears salesmen, paltry incentive to "spiff" as compared to PCs - yep, it looks like the Best Buy fiasco all over again...

But it looks like Apple is on the right track that they've decided to get replacement workers to fix the mess, you probably would have screwed it up even worse...

again, TiFKAS - ready to surrender?

There doesn't seem to be! I just hope his projects are financially viable, as it is one thing to have innovative ideas but another to be able to get them on the market without asking an arm or leg for the 'priviledge' of buying stuff. Also the New Zealand dollar is a pile of crap (in ForEx terms at least!). We used to get 0.41 UK Pounds per NZD...now we get 0.32...all this in a 2 year period. The price of UK software hasn't moved much so that means a massive increase in the cost of buying software for we Kiwis...that ultimately would also affect

production
costs and exporting OUT of NZ detrimentally...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

A good 3 chip DV camcorder ALONE costs $4g.. and you need a deck if you don't want
wear and tear on your camcorder, another $4g.. 128megs RAM isn't enough, 12 gigs
isn't
anywhere NEAR enough, a single monitor is almost ridiculous for this type of work.

Of course, you wouldn't know that because you've never done it!!

We already DID the math, Einstein.. and guess what? Your figures are wrong as
usual.
Remember my post outlining the costs? dejanews, if you don't..

Keep talking.. you keep making yourself look MORE and MORE like the internet
MacWacko
stooge.

Good work as usual, PS.

Of course, I predict that TiFKAS will ignore what you're saying and keep on wibbling on about how Final Cut will be the be-all and end-all for video production, despite the fact that he's such a cheesehead he couldn't even use a disposable Fuji camera without hurting himself.

Honestly, I think TiFKAS is actually, unknowing to himself, trapped INSIDE the Steve Jobs Reality-Distortion Field� and is slowly running out of oxygen as the methane levels rise inside, thus his constant hallucinating about things as he sees fit as opposed to the truth...

BTW, TiFKAS - a report on Macintouch recently reported a CompUSA recently selling a brand-new original release iMac for $600 US. I thought InCompUSA was supposed to have flushed those out of the channel months ago...

Done what?  I have used FCP and had access to the above eqipment above.
You are missing the point here.  The DIGITAL editing tools centered
around FCP and the G3 B/W has opened up a new market for Apple.  Folks
```

can start out small and improve the tools as time goes. Not all have
$25,000 and up capital to start with.

FCP will become 2.0 and beyond, while DV equipment will prolipherate and
prices will fall. As past history is any indication. Remember the
early history of desktop publishing?

BZZT - WRONG! You have been constantly bragged about how FC is supposedly posing a threat to Avid to force them to drop their prices. Avid is a professional software compnay. Are you once again in denial - or are you once again trying to rewrite your own history.

I repeat - Particle Salad is a PROFESSIONAL who KNOWS what he is talking about. TiFKAS is a known CHEESEHEAD who knows next to NOTHING about the video industry...
>
>Time to take a time out on the Sompsons and South Park.

You know, everytime TiFKAS posts, does one hear the voice of Cartman whining for his Cheezy Poofs?

BTW, it's The Simpsons. TiFKAS is still upset that the ingenious Matt Groening slighted Apple in one of their classic episodes (""WHAT computers?")

>Are you envy of Job's sucess?

it's "envious" and "success". Still can't spell, can we - or has Apple's requirements for employment dropped?

And why would I be envious of someone whose failures are now coming to light, especially now of the news of the P1 notebook being significantly delayed or even being cancelled because of the problems they've uncovered (including the notebooks catching on fire), and because of criticism that they've been unable to supply Powerbooks to their dealers while they seemed to have plenty to sell at the Apple Online Store? And who has been confirmed by the recent telefilm to be much a crybaby and bully much like yourself when he/you can't get your way?

" At this time, there is no Mac that is as fast for gaming as a Pentium III with a top-of-the-line 3D card. Period. I have been misquoted by some Mac evangelists as saying otherwise..." - John Carmack, iD Software.

Gee, that's enlightening.. if not completely obvious! I never argued with this.

Again, I didn't argue with this either..

You are a moron. I don't CARE what tool, platform, software package, whatever that helps me get work done. MORE choice is a good thing for me (not for you, because you're a simplistic apple stooge).

When FCP becomes ready for prime time, I'll be HAPPY to use it daily. BUT the problem is, YOU are the gentleman who likened it to an AVID and said AVID is "scared." This only proves you are clueless..

Moron.. where's the "threat?" I'm GLAD FCP exists, and will buy it and use it when it's
ready. It will help me eliminate Premiere from my video arsenal.. but it won't make me
sell my AVID anytime soon.

Not everyone is a simpleton "evangelist" who actually care what platform/tool they use to
get work done. You see, MacWacko, most of us use whichever platform/tool WORKS BEST. When
FCP works best, I'll use it.

I've rarely read the postings of such an obvious, unabashed simpleton on the internet
before. Congratulations.. you've reached a new low!

Ain't that a bummer! Fancy not supporting low density Mac disks and yet
supporting low density DOS disks!!! Is the iMac really a Mac??!! :)

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Feeling scared? The days of high billing to clients will come to an end
just as when desktop publishing tools fell in price that beging the road
to commodity...

Avid is also a professional proprietory hardware company as well. Once
FCP reaches version 2, 3 and beyond...Draw your own conclusion...

once again in denial, I see. We're talking about the software, not hardware here.

And once again trying to dodge the issue of the problems reported regarding FCP. Nobody's going to trust Apple on the next revision if they can't fix what is proving to be such an embarrassing flaw that should've been caught before it even left the lab. Even Apple is admitting they goofed...

nope, try this:

http://www.msnbc.com/news/282445.asp

this is where I found the original news story to begin with, complete with sources from within Apple and from the well-respected web site PowerBook Central. They said the Titanic was leak proof as well, did they not? :)

and of course our paranoid little friend TiFKAS will claim that it's all a big conspiracy by vested interests to try to smear Apple - when in reality it's TiFKAS getting smeared all over the information superhighway by the truth. Just like his inability to prove his charges that any PC debunking of how Apple cooked the G3 speed tests were also a similar conspiracy, or his denial that he was sucked in by a story from the totally unreliable Daily Tubby that you couldn't find coloured iMacs anywhere in Canada in the month of April when it was obvious Conrad Black's reporters (and also the Montreal Gazette's) didn't do their homework and follow up on what was basically puffery from the Apple Warehouse, which this self-style "Atari Boob" was able to debunk just by making a few strategic visits and phone calls...

no, you buy the best machine for the combined job - and as John Carmack said, it ain't the Mac at this time...

"The lunatic is the man who lives in a small world but thinks it is a large one; he is the man who lives in a tenth of the truth, and thinks it is the whole. The madman cannot conceive any cosmos outside a certain tale or conspiracy or vision. Hence the more clearly we see the world divided into Saxons and non-Saxons, into our splendid selves and the rest, the more certain we may be that we are slowly and quietly going mad. The more plain and satisfying our state appears, the more we may know that we are living in an unreal world. For the real world is not satisfying. The more clear become the colours and facts of Anglo-Saxon superiority, the more surely we may know we are in a dream."

-G. K. Chesterton (1874-1936), British author. And a better description of how TiFKAS operates I couldn't have said myself.

Man, you know even LESS about the subject then I EVER imagined.

Peter.. TIFKAS.. MacWacko.. let me explain it in small words for you. As tools get cheaper,
people STILL need to know how to light, shoot, edit, etc. The whole paradigm has already
happened in the audio world, and guess what? The big studios haven't gone out of business!!
Why? Because people don't know how to mic a drum kit without years of practice.. and also
because, as good as small personal recording studios have gotten, they STILL lack the expensive
quality outboard processing of the major studios, and most people cannot get that sound at home
unless they are experienced.

Not to mention that, as I've said before, there's no threat to my personal livelyhood because I
work in house for a software company.. we already OWN an AVID. My in house clients don't care
what tool I use, and neither do I as long as it works right.

Think Again!

3:28 PM]

Wall Street Joins The Apple Products Rumor Game

Reuters is reporting that Salomon Smith Barney have issued a statement saying they believe the P1 is on track for being introduced this July at MacWorld. According to the Reuters report:

Salomon Smith Barney analyst issued a report saying he believes that Apple's new consumer portable computer is on track for launch at MacWorld next month.

In the past week, some reports on the Internet have surfaced speculating that Apple is having production problems with the much-anticipated consumer portable and that it could be delayed. One report, on MSNBC.com last week, went as far as to say that Apple was even considering scrapping the project.

"There were reports last week that Apple's new consumer portable might be delayed," said Richard Gardner, a Salomon Smith Barney analyst, in a report to clients. "We believe the new product is on track for a July 21 introduction."

Apple officials in Cupertino, Calif. declined to comment on any details of unannounced products, nor will they confirm analysts' speculation that the rumored product will be launched at MacWorld in New York on July 21, where interim chief executive Steve Jobs is due to give a keynote address.

"We announced it awhile ago, saying we would announce it in 1999," said Natalie Welch, an Apple spokeswoman. "Unfortunately, we are not announcing anything further. We said we would release it in 1999 and we are on track."

There is more in the Reuter's report that is worth reading and, as always, we encourage you to do so.

The Mac Observer Spin: This is very interesting. Apple is notoriously tightlipped when it comes to advance product information. This is certainly more so the case with Steve Jobs at the helm. One of the first things he did upon assuming the throne at Apple was seal all the numerous leaks that were saturating the Internet.

Ms. Welch's statements quoted in the Reuters report is actually much more informative than normal. Rather than saying we just don't comment Mr. Gardner, she confirmed that the P1 is on track. Whether that is true or not is another matter, but we believe it to be the case.

Richard Gardner is perhaps the most Bullish Wall Street analyst on Wall Street, but it is still a bit unusual to see Wall Street leap into the Rumor Game. As Mac users on the web know, nothing piques the interest of Mac users more than a juicy Apple tidbit, but the Wall Street Boys and Girls are more interested in seeing information affect the stock market. In today's case, the effect was a big jump in Apple stock. We will cover that in the Apple Stock Watch report shortly.

Interesting.. not only are you a MacWacko "evengelist" blinded by religious fervor like some wacko holy terrorist (as if a stupid COMPUTER is worth being so passionate about), you pick someone who uses Macs daily in audio and video production to hash this out with.

Only an idiot allows the marketing hype to blind him to the obvious facts.. the Mac, like the PC, your car, your toaster, or your toilet, is just a TOOL. They each help you get things done. When they start getting in the way, you get a new one, whichever one works best at helping you get things done.

That's the way most people feel, anyway.

TIFKAS, the MacWacko extremest "evengelist" thinks different(ly). He doesn't have any work to get done, except to SELL the tools. He has to hype his little tool, because in doing so he feels validated, it makes his life somehow meaningful, it makes him feel superior. Unfortunately, like many people, it will take him some time to realize the futility of it all.. like the money grubbing baby boomers of the 80's discovered, someday he will finally see that all his MacWacko rantings and hype-parroting have not made him a better person.. have not helped him contribute to society.. have not helped him develop.. have not helped him learn about himself.. and have not helped him CREATE.

Then, and only then, will he search out the bigger truth and not waste all his precious time trying to prove that his tool is somehow better then all of the others.. only then will he discover that those who are CREATING don't CARE what tool they use.

The creation is the important part, NOT the tool.

-Mark

PS.. I apologize to the Atarians here who actually enjoy debating the MacWacko..
sometimes I just
get so tired of the idiocy.

On 30 Jun 1999 16:24:05 , having cursed himself at not putting his Depends on
before he read the news about the new Atari-badged Milan coming to the US in
April 2000, The Idiot Forever Known As Sinclap wrote:

>>   once again in denial, I see. We're talking about the software, not hardware
>> here.
>
>That the beauty is..It's in the software stupid!

yep, and it's in the software that FCP fails at being the Avid killer you
were claiming it (and now denying you ever said) to be...

>
>> And once again trying to dodge the issue of the problems reported regarding
>> FCP. Nobody's going to trust Apple on the next revision if they can't fix what
>> is proving to be such an embarrassing flaw that should've been caught before it
>> even left the lab. Even Apple is admitting they goofed...
>
>Whats the embarrassing flaw? Who is not going to trust Apple? Or is
>this the Atari Jihad view..?

nope, not according to the devoid-of-imaginary-Atari-Jihads Macintouch, which for some reason you seem too scared to read. FCP has been getting complaints from their users about it actually self-destructing in the middle of projects. Apple is admitting there's a flaw...

>Anybody can claim to be a professional just like yourself...Your a Atari
>Jihad Veep prof that has no ambition for the top...-)

Now this speaks volumes of just how dense you actually are, TiFKAS.

Firstly, there is no shame in being Vice-President of a computer club. Everyone who finds out about my position finds it to be infinitely cool and a badge of showing my amount of commitment and intelligence. Of all the people who have commented on my being Vice-President of TAF, yours is the only negative one - and, to me, is nothing more than flatulence in the wind like all of your so-called "pronouncements" about the state of Atari, which we have all come to accept as the wibblings of a punch-drunk little loser who's unable to make friends in the real world, and who is unable to admit defeat when so many have shot down your pathetic little attempts of embiggening himself...

Secondly, the fact that I was able to find myself a nice new job that is paying me more than the last one (and I was getting above minimum wage and benefits) shows how much ambition I have. BTW, people who have "No drive and no ambition" don't do wild wacked out things like jamming with a professional rock musician like I did last week at a guitar clinic with ex-Mr. Big guitarist Paul Gilbert (BTW, I'll be posting up a picture of me with Mr. Gilbert when I get it from a friend of mine, and the URL of where you can find it)

Thirdly, Particle Salad has constantly showed his expertise and knowledge and issues regarding video production and the business in general, while you just respond over and over and over with the same old parrot-sheep lines about how FCP is making Avid "scared" with no evidence whatsoever. Perhaps it's your resentment of the fact that PS has once again made you look like the world's biggest "kook" that you, in insane jealousy, are trying (and I emphasize "trying") to denigrate him by claiming he's faking his claims. Well we, in this camp at least, believe he's for real - and I and other members of TAF are enjoying his debunkings of your drivel and kicking your little butt all over cyberspace...

Fourthly, you're right - anyone can claim to be whatever he wants on the Internet. Which comes to YOU. Several of us, both in discussion on IRC and in person, are beginning to suspect that, due to your constant idiocy and spelling mistakes and huge gaffes over even Apple-related stuff, that you are actually bluffing about your even being an "Apple Power Rep". I believe that when someone here asked for evidence of your actual employment by asking you to post to him in e-mail your supervisor's number to confirm you were actually employed by anyone related to Apple, you chickened out and complained loudly that doing so would open opportunities for the imaginary "Atari Jihads" to harass your boss.

For all we know, you could well be living in your mother's basement in Indiana, posting your drivel from a Commodore 64 that you've set up to access deja from your Earthlink account as well as getting e-mail from the Apple E-mail news service for your steaming piles of drivel. That might also explain why you're afraid to have the cojones or the backbone to post any of your "Apple Good News" to the comp.sys.mac.advocacy or comp.sys.pc.advocacy forums, because the thought of getting burned beyond recognition by the more knowledgable professional people in these forums (many of whom also use Avid) has you all scared.

An interesting example of this phenomenon is Roger Sheppard, your old flaming companion on comp.sys.atari.st who claimed that he was an older technician who had an all-powerful PC and was on a mission to convert us "useless teenagers on the dole" to throw our Ataris in the trash. It turns out, after Mr. Sheephead had (through no small effort on my and a few others' part) gotten turfed from the New Zealand Freenet for his unfortunate tendency to make racist remarks, that someone from NZ filled me in on the discovery that Mr. Sheppard was a punk kid who didn't even own a PC, but was accessing government kiosks in shopping malls and libraries to post his own brand of drivel.

Now's the time to walk it like you talk it, TiFKAS. PROVE you are what you claim you are - and NO excuses.

>> > >>
>> >> >Are you envy of Job's sucess?
>> >>

>Yo ma ma!

you mispelled "Yo-Yo Ma", considered to be one of the best classical cellists of his generation, who recently opened a park at Toronto's harbourfront based on the movements of a classical composition. Mr. Ma is a gentleman, and will be remembered long after the last of TiFKAS' drivel is erased by deja.com in a bid by them to erase their old image of them being the USENet version of training wheels by cretins who can't set up a REAL USENet newsreader...

    (standard TiFKAS parrotting of a press release from a Mac fanboy site
deleted)

    well, Mr. TiFKAS realizes his position is tenuous when he doesn't even have
the guts to post the URL of his alleged "evidence" here, unlike what I have
done. Hmmm, more Conrad Black type parrot-sheeping....

    Too bad the "leak-proof" Apple had to hit that iceberg called MSNBC. :)

Who is stupid? Not the software..

It's in the LACK of hardware.. lack of component video i/o and lack of balanced audio
i/o that make FCP a solution for amateurs and low level pros who ONLY shoot and edit
a DV varient.

Of course, you wouldn't know that..

> Whats the embarrassing flaw? Who is not going to trust Apple? Or is

> An interesting example of this phenomenon is Roger Sheppard, your old flaming companion on comp.sys.atari.st who claimed that he was an older technician who had an all-powerful PC and was on a mission to convert us "useless teenagers on the dole" to throw our Ataris in the trash. It turns out, after Mr. Sheephead had (through no small effort on my and a few others' part) gotten turfed from the New Zealand Freenet for his unfortunate tendency to make racist remarks, that someone from NZ filled me in on the discovery that Mr. Sheppard was a punk kid who didn't even own a PC, but was accessing government kiosks in shopping malls and libraries to post his own brand of

drivel.

Roger Sheppard was an argumentative troll at times, but I don't think all the story lines up. To start with the internet access in this country is very very costly compared to the rest of the world, net kiosks are only just beginning to appear in shopping malls (rate is NZ$2 per 10 minutes), and access through a library is of similar cost.

If Roger Sheppard was a 'punk kid' then it is unlikely he would have been able to afford to post the number of messages he once used to. Also, the services that he is said to have used did not exist 2-3 years ago, which is about how long it has been since I have seen him post anything into comp.sys.atari.advocacy...

One thing is unanimous: Roger Sheppard and Peter Sinclair-Day remain the two most uninformed, cretinous knockers of the Atari platform to have ever breathed the air on this planet. But I'd be happy for them to keep doing what they do because every day is not complete for me without having a good laugh at the ignorance of others!!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

He has shown nothing! He is running scared like when the traditional
publishers were wiped out when publishing systems became commodity which
opened more creative types with some money to purchase such systems.
FCP will make video production technology a commodity service industry.

So what am I scared of? Can you actually post an intelligent response?

I have experience and knowledge in the industries I work in. Joe Shmoe with FCP
is no
threat to me, until he spends several years learning how to shoot, light, mic,
process,
edit, etc.. and even then, once he does all that, he's STILL no threat to me
because I
work for a company doing in-house work.. no competition. They quite like what I
do..

> Such fantasy...I thought your new above minimun wage job keeps you
> busy...:-)

Resorting to personal insults displays your lack of reasoning ability.

How do you "accelerate" a market? You don't even understand basic econonomics.

So I'll pretend I understand what you MEANT.. that is, putting it simply, that FCP is bringing desktop video technology to those who haven't had it before ("not everyone has $25k").

FCP is a very SMALL step in the desktop video evolution. The price and performance of hard drives, the creation of the DV format and low cost high quality camcorders and decks, and the increasing speed of computers in general has FAR more do to with the increasing use of computers for desktop video. To say that a simple piece of $1k software is more responsible then years of technological innovation is.. silly, even judged amoung your other, MacWacko, TIFKAS, MacParrot standard. Premiere was FAR more responsible for getting video on the desktop then FCP.. no question.

To say that FCP is somehow had ANY affect beyond a MINUTE amount is displaying, once again, your extreme lack of knowledge of desktop video hardware. A Targa card is VERY inexpensive.. and people who couldn't afford AVIDs have used them for years. Now, if they've switched to DV shooting, FCP and a B&W is a vaible switch for them.. and an increase in performance.. although, thanks to Apple's blunders (lack of 6 slot machines for quite some time), some of them have switched to Windows NT based systems (who may or may not switch back.. they can get a DV i/o card for $600)..

How many people do YOU know, who haven't worked in desktop video, would pony up well upwards of $6k just to do so? The pros won't, because they need PROVEN technology

(which I'm sure FCP will be in a year or two.. but not now). As you've pointed
out,
AVIDs have come down in price.. why buy unproven technology? The wedding guys
MIGHT, if
they've changed over to shooting in DV.. if they haven't, it's pointless for them.

If you had any knowledge of the industry, you could do more then just parrot the
apple
press releases. Can you discuss any of this intelligently? So far, no..

Don't simply be a MacWacko, MacParrot, "evangelist," TIFKAS. Think for yourself
and do
your own reasoning. It's not that hard, trust me.

>appear in shopping malls (rate is NZ$2 per 10 minutes), and access through a
>library is of similar cost.

okay, so obviously there have been some crossed wires there or something had been misunderstood. I therefore should stand corrected on what I said on his situation. All I was going on was a letter from someone in New Zealand who had informed me on what was then the current situation on ol' Roger.

One thing is for sure, though - I did have to write e-mail to the New Zealand government to file a complaint on his pathological and abusive behavior towards a number of people, including his personal vendetta againt Brian Becroft and the racist remarks that wound up being his undoing, as that was a government line where he was posting from. Perhaps he had access to a friend's office computer?

well put - to paraphrase what was said in one of my favorite Bloom County comic strips, it's great to come home after a bad day, flick on comp.sys.atari.advocacy, and see people who are even punier than we are :)

yes, built by Milan GmBH. No, not badged as a Milan, but as an Atari complete with Fuji symbol (they're in negotiations with Hasbro). No, it'll be priced lower than the overpriced, underpowered, overhyped iMac - and it'll have industry standard ports, including USB. Yes, Motorola is taking a co-production hand in this new computer as well, seeing as the Milan was selling 50 computers a month since August '98 (pretty impressive for a small company making what is considered a "dead" computer). Yes, TiFKAS needs another change of underwear. No, TiFKAS is no expert on Ataris, seeing that he's still too chicken to reply to my debunking of his brain-dead slam of the Hades.

Need proof? http://bengy.atari.org/ali.htm , interview with one of the head honchos at Milan GmBH.

>Chunks wrote...

see, TiFKAS is so upset about the fact a new Atari-badged computer is coming on the market, he's begun hallucinating about his imaginary friend "Chunks", who, like his imaginary "Atari Jihads" who are "out to get him", has never existed...

Again - I was making above minimum wage in the last job. I am making TWICE
as much as I was in my current job. Do the math - or is that as bad as your
spelling?

Well rounded? Nope, you must be mistaking me for your imaginary friend
"Chunks".

Sorry, don't read Stephen King (whose name you mispelled). I prefer serious
fiction like Terry Pratchett :).

TiFKAS is obviously jealous of the intelligent satirical genius that Matt
Groening is that has allows him to live comfortably with his creations. It is
also obvious that he hasn't seen enough episodes to know that it is more than
the ka-ka-poo-poo humour that George Bush tried to make it out to be. Speaking

of which, TiFKAS is as much an Atari expert as George Bush is an
enviromentalist :)

OK. I never have met Roger Sheppard. It does sound as though whoever wrote that
letter wasn't being entirely truthful (imaginative sounds better!). Myself I used
to try and track where this mysterious Sheppard fellow posted from...I never did
succeed so he must have had some form of 'borrowed' access...

I didn't realise he had been 'abusing' people by calling names! Brian certainly
isn't a deserving target; I met him about 2 years ago and he was a pleasant chap
who was easy to get on with, and a good musician to boot...he had a demo CD he
had recorded with Cubase Audio on his Falcon which sounded very nice...

The thing is that we aren't puny!! We are strong because we can resist the call
to buy Micro$loth or Macintoss that so many 'sheep' around the world have been
succumbing to. I think the sheep living in abundance in the farms of New Zealand
are more intelligent (and endearing!! ;^)) than your average Wintel or Muck user.

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Why don't we Atari users form a Jihad sect? Get into crazy stuff like
stalking janitors from the University of Iowa with high-powered water
pistols! :)

At least then TiFKAS would have experienced a form of reality that
thus far has been absent from his deluded mind...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

And his complete lack of valid argument to reason with! If Sinplop
even had an argument to reason with he wouldn't even know what to
do with it! His arguments add up to DIDDLY SQUAT!, which is what I

would expect a smarmy jerk-off kid of say age 14 to come up with!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

50 Units a month...Wow....that should bring back thousands of developers
in the fold....Not! So is this new video game box will use a 68k or
PPC?

Also the "overpriced" iMac has sold pretty well thus far according to
the market research firms...

> Need proof? http://bengy.atari.org/ali.htm , interview with one of the head

Teaching CompUSA sales staff about Apple and the Mac

6/30 - Rodney O. Lain

> If you agree with everything that I say, then you're not thinking.
>
> --I once heard someone say this

A few weeks ago, I reported CompUSA's new initiative to educate its sales staff on things Macintosh. Last week, I mentioned that my boss at CompUSA asked me to help lead the Mac classes. Well, this week we completed that training, and I must say that I am actually becoming more optimistic about CompUSA as a national Apple Macintosh presence.

Here's the gist of what happened:

We had two classes -- the Tuesday night session for half of the sales staff and Thursday night for the second half of sales guys. The first night was more of a lecture and a hands-on with the store's demo Macs.

Tuesday night

The Apple rep conducted the first half of the meeting. He outlined the Mac market in the Twin Cities; I was pleasantly surprised to find out that the Twin Cities is the fourth-largest market for Macintosh sales, given the heavy concentration of publishing houses and creative-content professionals. He also gave a breakdown of the Minnesota demographics; i.e., he described the typical Mac user.

Then it was my turn.

Maybe I'm becoming a more mature Mac bigot, but I had no urge to describe the Mac as the world's greatest computer (even though it is). My approach was more of an appeal to their logic. I explained the statistics supporting the fact that the iMac is the best-selling computer since its introduction. I gave the anecdotal example of a customer whom I had met. She said that she'd been in the store earlier that week and a sales person talked her out of buying a Mac. I told the group that that woman had bought no computer, when in fact, she had come there specifically to buy a Mac. The store lost money due to some idiot sales person's dislike of the Mac.

"Hey, I sell Packard Bells, if that is what the customer wants," I told them, "even though I hate Packard Bell computers. You should have the same approach towards the Mac. The sales person's computer preference should have no bearing on the customers needs and wants."

I stressed the fact that the Mac is no different than any other computer, in terms of sales: it has peripherals; it has software. I explained that Mac users buy a disproportionate percentage of software, peripherals, etc., considering the Mac's small market share.

I explained that the Mac OS is the #2 consumer OS in the world, a fact that people consistently overlook. I explained that the iMac single-handedly made USB an (emerging) standard.

After my presentation, the staff was shown a video on the Mac OS. After that, the Apple Rep and I led a tour of the Apple section and demonstrated the features of the iMac.

As the Apple Rep talked, I pulled aside one of the sales people and asked, "how long does it take to network two PCs?" Then I asked that he time me as I network the display iMac and my PowerBook G3. I clocked out at 2 minutes, 47 seconds. When there was a lull in conversation, I told the group what I'd just done.

"He actually did it in just 2 minutes," my "timer" noted, "it took him 47 seconds to remember his password."

Several of the sales guys asked questions afterwards and expressed more than just a passing interest in the Mac. There was actual interest.

Thursday night

On Wednesday night, I caught a brainstorm. I was playing around with my PowerBook and noticed that I had Microsoft PowerPoint (which I'd been meaning to learn). I thought it would be a great idea to put together a slideshow presentation. So, one hour later, I'd put together something to present Thursday night. Did I mention that I'd never created a PowerPoint presentation before?

Anyway, the next night, I got to the store and set up the projector to run off my laptop. I also made sure that when the staff made in, they'd see the OpenGL screen saver that I have recently installed. That gave me a chance to make a nice segue into the fact that SGI's OpenGL API's are the standard for game development, and that it is now a part of OS 8.7 and beyond.

Thursday night's training went well, also.

The aftermath

The results of the training are pretty evident. The sales people spend more time in the Mac section nowadays. They spend time keeping the shelves stocked; there are more people involved in the Mac sales (if we could have more to sell, it would be nice, though).

I also took advantage of the situation.

One of the sales staff mentioned that it's hard to sell Macs, because many of the peripherals, software, and hardware are not in stock, even though we know they all exist. I asked our manager why CompUSA doesn't stock the peripherals that are being sold for the iMac (USB adapters, SuperDisk drives, etc.). I did that for two reasons:

1. I really wanted to know, and
2. that shows the sales staff that it isn't Apple's fault for not having inventory in stock.

A few hundred more complaints/suggestions of this sort, and we'll have Mac peripherals in the store for a change.

A side-point to all of this: on Sunday, two customers came in who turned out to be CompUSA employees. Professing to be big-time Mac users, I asked them if they have any "pull" with Jim Halpin (CompUSA's CEO), for I wanted them to pass on some complaints of mine. It turned out that they are national trainers for CompUSA' larger corporate accounts. We talked for a long time, and I noted that if CompUSA doesn't shape up that iMac sales may go to places like Sears.

Another interesting side-point to all of this is now that I know PowerPoint, I spent the weekend putting on PowerPoint presentations (when sales were slow) -- something I plan to do on a regular basis now. You see, I obtain regular copies of the Apple Sales and Marketing Resource Library. This is a set of three or four CDs chock full of the latest info on Apple products (congratulations to Apple's marketing group. Suggestion: could you make the disc a hybrid CD? You know, for Windows and for Mac? Not all sales have Macs�). For example, this month's CDs consist of complete PowerPoint presentations on the PowerBook G3 Series, Final Cut Pro, QuickTime 4.0, WebObjects "Success Stories"; also included are QuickTime movies of Worldwide Developer's Conference speeches/sessions (the Mac OS 8/8.7 Overview, OS X Overview, for example), The PowerPoint files are a great help. I set them to run � la a store kiosk. I set them to loop continuously and swapped them out regularly throughout the day. Customers were treated to presentations on Apple products, as well as DVD movies ("Austin Powers" and "A Bug's Life").

All in all, I think that things in our part of the world are doing nicely. If the management in other stores put forth the effort that we did, then the implementation of Mac training at CompUSA will be a smashing success.

--- Rodney O. Lain, rodneyo@macconnect.com.
Rodney O. Lain, a former university English and journalism instructor, works full-time as a software developer and works part-time at a local CompUSA Apple Store Within A Store. A card-carrying member of the local Macintosh User Group Mini'app'les, Rodney writes this column exclusively for theimac.com. His greatest desire is to become an African-American Guy Kawasaki. A self-professed "workaholic writer," he waxes prolifically about race, religion, and the "right OS" at "Free Your Mind & Your Behind Will Follow", his unabashedly pro-Mac website. When he's not cranking out his column, he collects John Byrne comic books, jogs, and attempts to complete his first novel. He lives in Eagan, Minnesota, a southern suburb of St. Paul.

this makes no sense!
If an atari floppy disk drive (any sort, TEAC, SONY,...)
can read 800K MAC disks (via Spectre or transvertor)
yhen what is the problem with the Imation drive?
reading formats is _only_ a matter of software, non?
ken

Right....

the same for LIST and ENTER commands also...

Interesting.. no response from the Avid Expert Known As Sinclap.. AEKAS. Maybe he has finally come to the realization that he doesn't posess the knowledge to make an informed rebuttal?

That would be nice.. of course, TIFKAS/AEKAS would NEVER admit publicly that he doesn't know what he's talking about.. that would actually take some humility and intelligence, traits I haven't seen from him before. He'll probably choose to either ignore it further, or make a quip instead.. standard practice when you don't know enough to make an intelligent argument.

-Mark

Without DOS you can't read a disk, but most pre-recorded disks have some
sort of DOS.  First you turn on the drive and insert the disk, then turn on
the computer.  If it says "BOOT ERROR", you need to get a DOS disk.

NT is *much* better. Partly because Plug-n-play and all of the other 'easy to use' (which is not easy for most machines) doesn't exist in NT.

It's faster and actually does preemptive multitasking.

Win95 says it can do preemptive, but only with 32-bit code. When you consider Win95 has enough 16-bit code in the core of the OS, there's no way in hell Win95 (or 98) will ever properly preemptively multitask. Microsoft misadvertised. is that not illegal?

Let's go through this one by one:

Clockmeister wrote in message <01be9afb$ffc93dc0$a65e0fcb@default>...

>Sure, I've had the usual GPF's and complete system lockups that are
>standard with Windows, and the multitasking is a pretty crap too, not to
>mention the slowdowns when things get heavy.

That's typical for most OSes. When you have more apps open, the system will slow down then trying to pre-emptively multitask them all. Depending on how good the OS is, you can multitask more apps than on other OSes. Amiga, Mac, and Atari ST are in the same boat for locking up. And even Unix can have its day since nothing is perfect so don't say anything Unix techies. Stuff can happen with Unix, maybe not as often.

>All in all though, I think that a lot of problems arise from users lack of
>knowledge and that other problems are extremely exaggerated by those who
>hate Windows solely for the monopoly it represents.

I don't hate Windows. Rationally speaking, I can't hate Microsoft. Microsoft saw IBM was peddling a computer (a true piece of junk if you read up on technologies available in 1980...) Any one of us would have made the same decisions, given the opportunity. Any one of us who bothered to notice how big IBM was and Digital Research (IBM's first contact) was run by a truckload of cretins. This is why they turned IBM down! idiots, I have no sympathy for them...

IBM used its *name* to sell the product and give it the facade that it was for business. (I wouldn't sell a badly designed CPU which was slower than many other 8-bit and 16-bit CPUs of the time! The Motorola 68000 was made in 1977 and had more than the i8088. The i80386 (1985) finally caught up to the 68000 (1977)). The machine sold, of course, and Microsoft stuck along for the ride. Intel, who made the worst microprocessors of the time (and still do) had a larger role to play since Intel chose them (because the CPU was fourth-rate, even by 1980 standards).

In the end, it's IBM I cannot stand.

>Has anyone in this group had a reasonably good run with Windows, or am I
>alone here?.

I don't like Win95 because plug-and-play only works on very simple machines, if for nothing else. I use WinNT and I enjoy it, but I'd much rather use the Amiga - which was the most resource-friendly of the entire scope of microcomputers.

I managed to lock up Linux once, but why it locked up remains a mystery...

The only thing in favour of the original IBM PC/XT was the 80 column
display which was lacking in most 8 bit computers of the time. For anything
else, PC's where truely abysmal.

  Any one of us would have made the

> in 1977 and had more than the i8088.

No shit. The Intel 8088 is a true masterpiece of retarded engineering.
Even today, the shortfalls of that monstrosity still come through on new
generation Pentiums.

  The i80386 (1985) finally caught up to

> the 68000 (1977)).

Yes and no. The 80386 did have more features then the 68000 (like VM and
FPU support) and the 80386DX was a clean 32 bit processor unlike the 16/32
bit 68000. The 68000 was a cleaner processor though, and far superior to
the 80286 so my guess is that it falls somewhere in between the 80286 and
80386SX.

The 68020 was pretty comparable to the 386DX feature wise, and certainly
performance wise in the right system.

  The machine sold, of course, and Microsoft stuck along
> for the ride. Intel, who made the worst microprocessors of the time (and
> still do) had a larger role to play since Intel chose them (because the
CPU
> was fourth-rate, even by 1980 standards).

Intel make a pretty decent processor these days despite the legacy. (not
forgetting the fact that the new generation Pentium CPU's are still just
over-glorified 386's). The rest of the PC architecture is a bit of a dog's
breakfast as well come to think of it.

> In the end, it's IBM I cannot stand.

You can't really blame IBM. After all, it was the gullible public that got
sucked into buying the damn things. No-one forced them to!.

But then, there are those people who are happy to keep spending money on
upgrades every six months or so just to stay current so I guess nothing
much has changed.

IBM did come out with MCA and OS/2 which where pretty reasonable
technologies at the time, but IBM shot themselves in the foot with MCA. The
licensing to use MCA in clones was super-expensive so the clone makers
simply didn't embrace the new technology. IBM got greedy, wanted it all
(including royalty on every MCA bus clone PC sold!) so the industry went
another direction. (VLB, EISA, and eventually PCI).

That hurt IBM badly :-)

> >Has anyone in this group had a reasonably good run with Windows, or am I

>
>
> I don't like Win95 because plug-and-play only works on very simple
machines,
> if for nothing else. I use WinNT and I enjoy it, but I'd much rather use
> the Amiga - which was the most resource-friendly of the entire scope of
> microcomputers.
>
Likewise, I'd choose an Amiga. It was the first (and only) computer that
had that certain awe of excitement and WOW factor. That old A2000 of mine

surprises me at times with what it can do, given the obvious age and hardware constraints of an essentially eighties technology computer.

And to think that the 68000 was the first processor considered for the first IBM/PC, but for compatibility reasons (with mainframe technology) they chose the i8088 instead. Pity...

Regards,

Clockmeister.

I have the following for sale or trade.
Atari Jaguar, Jag CD, 1 Jagpad, 11 cartridge games, and 3 CD games, Atari Jag Games Strategy Guide.
I'll sell the whole lot for $200.00 (shipping extra) or trade for an Atari Falcon 030, with ide internal hd,in good condition.
Interested persons send reply to my email address.
Thanks,
Sam

Oh, did I wake you?  Sorry.. were you dreaming about being someone who actually
did media work on the Mac?
I'm sure you enjoyed the dream, it's much more fun then being an uneducated
newsgroup troll..

and the above post shows that TiFKAS is still hallucinating and needs to go to Bellevue to continue the shock treatment, because:

1) his imaginary friend "Chunks" - who he calls up whenever he is losing an argument - doesn't exist.

2) the iMac has not been as big a success as he claims, judging by the PC Data report this month that showed that iMac sales actually slowed down significantly in April (the month his favorite source, The Daily Tubby, swore up and down that iMacs were "hard to find anywhere") Indeed, it mentioned that it was still possible to buy a brand-new 233mHZ Rev. B iMac at many dealers in the US! Looks like the Steve Jobs Reality-Distortion Field� is beginning to belch smoke again....

3) He still insists that Final Cut will take the place of the recently departed Avid, despite the fact that a professional video user in .advocacy

reduced him to chutney and revealed that TiFKAS doesn't know beans about producing video.

Now if he had only directed the above missive at me, rather than his imaginary friend, he'll have found that #2 - having the new job that paid significantly more and at an obscene schedule - would have been correct. And am enjoying a nice big video screen as part of the fruits of my labour on my Falcon, which, BTW, didn't require any "hack n' slash" to install....

>--
>"Although there are more Microsoft Windows users
>than Macintosh users, we would like to remind you

now I could set up a line saying that all Macintosh people are cockroaches, but I know Mac people better than that - the only one who could fit that job description is TiFKAS.

Would LOVE to see a cage match between TiFKAS and the equally brainless Mac-baiting PC-user Ho You Kong from mac.advocacy - they're equally matched for lack of intelligence and their ability to prove with their trolls that there is such a thing as negative IQ....

>

There is no Bellevue in Jesse Ventura's state. And speaking of Jesse,
can't you folks up north get it right that if you do a Ventura movie
that it's done accurately....

According to the April numbers if that you combine all colors as one,
the iMac is #1!

I doubt that Rev B ones are plentiful up north...

FCP is the beginning and will revolutionize the industry. Thats what
show goers and the Apple folks know during the Strictly Business show in
Minneapolis this past week which wore out sinclap...

Wow. You sure you aren't using "deja-vu" instead of "Deja-News"?

The reason I'm asking is because all your messages were posted
twice. Twice. ;-)

Ever try a "real" newsreader? Naaaaaah, that would require too
much technical expertise for a Slac, er Mac user...wouldn' it?

;-)

> to Bellevue to continue the shock treatment, because:

>There is no Bellevue in Jesse Ventura's state.

but there is Bellevue Mental Hospital in New York, which last I heard also takes patients from out of state. Your upcoming stay there, BTW, may not be as pleasant, as there was a news story out that they're taking out all their Macs and replacing them with NT boxes....

>And speaking of Jesse,
>can't you folks up north get it right that if you do a Ventura movie
>that it's done accurately....

up here in Canada Jesse Ventura is seen as a joke and as a crybaby who pouts when he doesn't get his way (very much the same way TiFKAS acts in .advocacy). He has an ongoing invitation to debate our provincial fisheries minister on why Missourians aren't allowed to take more than their regulated share of their fish over the border, and yet he has refused: could it be the fact that, like his former profession, he falls flat on his face if he doesn't have everything he does scripted?

You can keep your whining crybabies like Ventura, we have the Hart family up here (whose own documentary movie, also Canadian made, has been winning rave reviews on exposing the ridiculous spectacle pro wrestling has become).

> belch smoke again....

>According to the April numbers if that you combine all colors as one,
>the iMac is #1!

well well, it looks like TiFKAS has fallen in to the same parrot-sheep line that Steve Jobs requires all his mindless minions to squawk and bleat whenever damage control has to be done.

Using that same line of reasoning, let's add up all the Compaq Presario models sold that month! Or, let's add up all the HP models sold that month - it doesn't matter that they all have different features, they all say HP Pavilion on them! Oh, look, the iMac got ground into powder.

Just so you're keeping score, according to PC Data the combined sales of both 266mHZ and 333mHZ YUCK iMacs in April came it at #11. In order to make it to number one, you'd have to have a lot of original, Rev. B and Rev C iMacs in stock in be at #1 - why TiFKAS, you mean THERE ARE STILL OLDER iMACS FOR SALE IN THE US? They're NOT flying off the shelves like you've been bragging for all these months? You're not trying to slip us Atarians the old rubber peach just because you're a gullible child, are you TiFKAS?

>I doubt that Rev B ones are plentiful up north...

but there appear to still be lots of Rev. Bs for sale in the US, according to the report....

incidentally, the iMac commercials began running again one week after the PC Data report came out....

> 3) He still insists that Final Cut will take the place of the recently

> producing video.

>FCP is the beginning and will revolutionize the industry. Thats what
>show goers and the Apple folks know during the Strictly Business show in
>Minneapolis this past week which wore out sinclap...

of course TiFKAS would be tired if he had to clean out all those toilets in the convention centre like his boss told him to - with the precarious position Apple is in right now with the bottom falling out of the iMac market, heaven forbid that Steve Jobs would risk any further damage by letting TiFKAS open his mouth in the vincinity of any suckeHHHHHHcustomers.....

FCP is the beginning - the beginning of the end of the Mac video market if Jobs and the other clowns on Apple's board don't do an about-face and bring Avid back....

> Now if he had only directed the above missive at me, rather than his

> enjoying a nice big video screen as part of the fruits of my labour on my
> Falcon, which, BTW, didn't require any "hack n' slash" to install....

> What do you do now? Loading trucks in the UPS warehouse?

nope, in hardware again, and at twice the salary - and twice the store space. I'm actually working over two stores and am sent over to whichever one needs me that day. My bosses are quite pleased with my performance, how I handle customers, and how I'm often able to trouble-shoot problems, and they have both commented to me on how much they're surprised to find someone who actually enjoys the business as I do.

And it appears that once again TiFKAS has shown his utter hatred of those who work in the labouring field - of course, the pinhead has once again conveniently forgotten that labourers are an important part of a thriving economy, and since they also buy things like computers they provide the ingrate's salary. Of course, TiFKAS will once again deny that that was what he meant, but I'm sure that if he was man enough to say this in front of a UPS worker in the same tone of sarcasm, well I think that much hilarity will ensue..

BTW, I understand that UPS workers actually do make a nice living wage.

> >--

>Lets see...On day one I humbly recall that the Jagflop will fail due to
>market and Tramiels past screw ups...The list goes on...My batting
>average is high..

come off it, TiFKAS - anyone with even the cognitive powers of peat moss could have seen that coming. Let's face it, the Tramiels were so inept at promotion they couldn't even market immortality.

hmm, this coming from the same guy who said that Apple's leadership under Gil Amelio had "cleaned up the mess" from the previous administration right before they posted a $1 billion loss (and in the same breath called Steve Jobs an "arrogant bonehead" who would destroy Apple if he ever came back to power, but when Jobs DID come back TiFKAS suddenly developed a taste for shoe polish)- who said that "90% of all TOS applications fall over on the Milan" before it was even launched (and it has proven to be not only very compatible, but a surprise hit in Europe), who said that Sony and Connectix would sign a licensing deal for VGS (and instead wound up in a lawsuit, with Sony winning the first round by getting a court injunction against Connectix preventing them from selling VGS), who claimed that TAF was on its last legs and would have its entire executive voted out of office just because we were able to lower the membership fees (we were all voted back in by acclimation just two weeks ago), who brayed loud and long about how Pointcast would render Atari net use obsolete (and was yet pointed to as "Internet Flop of the Year" by a number of respected periodicals - shall we go on, or should we shelter TiFKAS' already cracking ego any further strain

>

>I guess the election did not go your way...

actually it did - I won my position by acclimation, as did Ken, our president. Why spoil a good thing? :)

BTW, we need your cranial dimensions, as we're busy designing your trophy for

your new enviable position of "A*****e Of The Year" - we finally found someone
who could mold a set of rubber buttocks and we want to ensure that your head
fits comfortably....

>Sent via Deja.com http://www.deja.com/
>Share what you know. Learn what you don't.

what did we learn from TiFKAS this time? This is what we expect from years of Sinclair in-breeding.

What did TiFKAS learn from posting using Deja? Mommy make cake. Cake good.

The hardware/lawn business? Twice the salary does not indicate if it's
twice the minimun wage which would still be dreadfull unless you have
kids to support..

Amelio was in the right direction with the financial controls but wrong
in the product category. Amelio and CFO Anderson set in motion the
restructuring. It was Jobs who initiated the iMac project a day after
he returned.

The $1 Billion loss was mostly a inventory write down...Not a lost from
operations. The Actual loss was below $200 million...

Apple's cash at the time was tied in $2-3 billion in unsold inventory.
Amelio lowered the value to write off to sell inventory to create cash..

Under Jobs and Anderson, Apple ends the the quarter with under $20
million or a days worth...Thats how they create $200 million plus cash
per quarter and sitting on $2.9 billion in cash up from $500 million
when Amelio took over..

Steve Jobs

Uh huh.. let's first analyze your numbers, especially 20% of the price.

You can easily get an AVID SYSTEM for around $25k now, including CPU, drives, everything you need.. turnkey.

For video editing on a G3 B&W, you need the most horsepower possible, which means 400mhz, tons of RAM, SCSI
RAID, etc. That just cost me $6k (18 gigs HD space, 256 megs RAM). I didn't get 2 monitors and a 2nd video

card for this price, but let's just say this includes it just to be charitible.. plus prices probably have come
down a bit. Now, you will still need software. FCP is $1g. Also, you need the advanced driver kit put out by
a 3rd party, as Apple's drivers don't support simultaneous input and output amonb other things.. $500. Oh,
you're a semi professional, and some of your video is on a pro format (Beta SP) and not DV (or even Hi8 or
SVHS)? You need an analog (component) to digital (firewire) converter for your Mac to get your video in..
otherwise, you're hosed. That's another $1g. What, you want to use time code on your hi8 or SVHS system?
Sorry.. only supported with DV, not any analog formats, so you can't batch digitize. Oh, sorry, you can't bring
in your audio from a DAT via SPDIF.. it doesn't exist on this system unless you add another $350 for another
card. Oh, how many card slots are left? Hmm.. wait a minute, I have a SCSI controller, 2nd monitor card, and
adding the audio card will leave me.. with none. No slots left for an MPEG decoder card.

OK, let's do the math now:

Turnkey AVID system: $25k
B&W G3 system: $6k+1k+1.5k+500+350= let's just call it $9k.

That puts the G3 based system at right around (over, actually) 1/3 the cost. Much different then 20% of the
cost, isn't it? Don't get me wrong.. the B&W G3 system is great, I own one.

But it's just not as reliable or professional.. anyone who says so is proving they don't know what they're
talking about.

Agenda for the June 16th, 1999 meeting of the Toronto Atari Federation:

As your classic Atari ST/TT/Falcon gets older, you may find that certain parts of your system may need replacing. Is your mouse getting tired? Has your mono monitor faded to black? Has your SH hard drive spun down for the last time? Where am I going to find replacements?

At this particular meeting you'll find the perfect solution to these questions, as we'll be showing off and doing demoes of three products done by the young New Zealand genius Mario Becroft that solves these problems nicely!

Astound! at the sight of attaching a PC three-button mouse to your ST via the Mouse Adaptor and make it perform double-clicks with one click of the central button! (Also makes a great gift for Amiga users!) Thrill! at getting a nice clear SVGA monitor screen via the VGA Adaptor - mere plug & play! AND! Prepare for the biggest surprise as we show you how to put a notebook IDE drive INSIDE your ST/STe's case via the new IDE Adaptor (which also opens some interesting possibilities - how about putting an iMation SuperDrive inside your ST for starters?)

If you've been worried about replacing mice, monitors or hard drives, this meeting is a MUST-ATTEND spectacle of technological marvel! See you there!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

TPUG AND TAF JOIN FORCES FOR A DAY OF EXCITING BARGAINS IN TORONTO!

The Toronto Pet Users Group (THE support group for users of Commodore's PET, VIC 10/20, 64 and 128, and the Amiga) and Toronto Atari Federation (North America's largest user group for the Atari enthusiast) are holding a joint Flea Market at the Alderwood United Church, 44 Delma Drive in Toronto, Ontario, Canada on Saturday June 19th from 11:00 a.m. until 3:00 p.m. If you own any of these classic computer systems and have been looking for hardware or software, or you have systems or software that you'd like to sell, now's your chance. Sell your old stuff, go home with a treasure!

The days of rivalry between the two competing systems are over, and users of both these platforms realize that it is better to cooperate rather than to butt heads. And indeed, with the Amiga's strengths in audio and graphics, and the ST/TT/Falcon's strengths in MIDI and DTP (not to mention the fact that both platforms make excellent and cheap machines for getting on and making use of the Internet) there is much that can be learned and shared between the two platforms by their respective users.

TAF will be there with copies of ST+ Fanzine for sale and with a number of Mario Becroft's excellent new products for adapting PC serial mice, VGA/SVGA adaptors and internal IDE drives to Atari STs (the Mouse Adaptor also works with the Amiga, so if you've got an Amiga with a dying mouse here's your chance to use one of the many excellent two and three-button mice available to the PC with your system), as well as info on how to join TAF.

It's going to be an exciting summer - and this will be the event to kick it off! See you there!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. While some users have found a loop hole in NAVAIRS order to purchase only
new PC machines, it seems that the ones that have choose to do this
have found that a large shippment of G3's to the NAWCWDPS have
defective video cards. In our group alone, 3 of 10 had to be returned.
More returns were reported at division levels.

So much for Apple quality control........

Mikey

Sorry Sinplop. This is no BS. I could provide proof, but you would be the only person to refute it. Besides, it's only the government and it's easy for companies like Apple to screw them.

What would you consider proof? A scanned copy of the returned authorization from Apple? Dealer repair recipts? Of course these would be forged, right?

Fuck you ass hole. When confronted with the truth, you only slither further in your hole.

Mike

Avid, today just announced price cuts by upto one 26%.

If you look closely, only 50,000 folks own such a beast...A G3 with FCP will exceed that number with one hand tied in the back..Looks like FCP has Avid worried..

However, a certain chunky and salad character would say otherwise...Looks like the dressing is causing saginess....

Avid Xpress is part of Avid's award-winning family of video editing products and offers both
compatibility with an upgrade path to the company's flagship Media Composer system. Avid Xpress
features the Avid editing interface, the professional choice of over 50,000 trained editors worldwide.

Avid Xpress for the Mac G3 is offered as integrated software and hardware kits (G3 CPU available separately). The US MSRP for new kit prices are as follows:

The Base bundle has been reduced by 6% to $9,999

The Plus bundle has been reduced by 22% to $12,999

The Deluxe bundle has been reduced by 19% to $19,999

The Elite bundle has been reduced by 26% to $29,999.

That's funny, the people were stupid and that was a trait microsoft exploited. Therefore the people are cockroaches yet the cockroaches are people.

In other words, so what? We're all life forms.

TPUG AND TAF JOIN FORCES FOR A DAY OF EXCITING BARGAINS IN TORONTO!

The Toronto Pet Users Group (THE support group for users of Commodore's PET, VIC 10/20, 64 and 128, and the Amiga) and Toronto Atari Federation (North America's largest user group for the Atari enthusiast) are holding a joint Flea Market at the Alderwood United Church, 44 Delma Drive in Toronto, Ontario, Canada on Saturday June 19th from 11:00 a.m. until 3:00 p.m. If you own any of these classic computer systems and have been looking for hardware or software, or you have systems or software that you'd like to sell, now's your chance. Sell your old stuff, go home with a treasure!

The days of rivalry between the two competing systems are over, and users of both these platforms realize that it is better to cooperate rather than to butt heads. And indeed, with the Amiga's strengths in audio and graphics, and the ST/TT/Falcon's strengths in MIDI and DTP (not to mention the fact that both platforms make excellent and cheap machines for getting on and making use of the Internet) there is much that can be learned and shared between the two platforms by their respective users.

TAF will be there with copies of ST+ Fanzine for sale and with a number of Mario Becroft's excellent new products for adapting PC serial mice, VGA/SVGA adaptors and internal IDE drives to Atari STs (the Mouse Adaptor also works with the Amiga, so if you've got an Amiga with a dying mouse here's your chance to use one of the many excellent two and three-button mice available to the PC with your system), as well as info on how to join TAF.

It's going to be an exciting summer - and this will be the event to kick it off! See you there!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

Agenda for the June 16th, 1999 meeting of the Toronto Atari Federation:

As your classic Atari ST/TT/Falcon gets older, you may find that certain parts of your system may need replacing. Is your mouse getting tired? Has your mono monitor faded to black? Has your SH hard drive spun down for the last time? Where am I going to find replacements?

At this particular meeting you'll find the perfect solution to these questions, as we'll be showing off and doing demoes of three products done by the young New Zealand genius Mario Becroft that solves these problems nicely!

Astound! at the sight of attaching a PC three-button mouse to your ST via the Mouse Adaptor and make it perform double-clicks with one click of the central button! (Also makes a great gift for Amiga users!) Thrill! at getting a nice clear SVGA monitor screen via the VGA Adaptor - mere plug & play! AND! Prepare for the biggest surprise as we show you how to put a notebook IDE drive INSIDE your ST/STe's case via the new IDE Adaptor (which also opens some interesting possibilities - how about putting an iMation SuperDrive inside your ST for starters?)

If you've been worried about replacing mice, monitors or hard drives, this meeting is a MUST-ATTEND spectacle of technological marvel! See you there!

Peter, TIFKAS, buddy, pal..

I could easily pick apart this week's lame, irrational, ill-informed, naive post from you.. but there's no point, as you don't discuss the points I bring up, you lack the intelligence to do more than just post quips..

I don't think there's a sole here who believe you have a clue when it comes to this stuff. Have you ever edited on an AVID? Er.. no? Have you even edited any video on a B&W/FCP system? Er.. no again?

You see, the difference between you and I is I KNOW what I DON'T know.. I would never presume to speak from authority on, say, computer sales. That's not what I do.

You, on the other hand, choose to do so all the time here.. proving once again you only have one agenda. Your agenda is not to tell the truth, because you don't know enough to know what the truth is. Your agenda is to sell more b&w boxes, truth be damned.

You prove each time you post about issues you are NOT informed about that you don't care about spreading accurate information, and you cannot EVER be trusted for an accurate analysis of any mac-related facts.

Looks like a certain person will upchuck 'chunks' of food solids in his split pea soup... Now he will swear that this came from a loony right wing rag...

School update 2: Toronto schools, more
by Dennis Sellers, dsellers@maccentral.com
June 16, 1999, 3:30 pm ET

The Toronto Board of Education has made a huge commitment to the Mac platform, possibly to the tune of 10,000 iMacs for Toronto schools, according to Don Nicklin, assistant director, Recording Arts

Canada.

Nicklin said this info came from an Apple rep who demoed some new Macs at a User Group meeting last week in Hamilton.

Michelle Fleitz' husband is a PhD student in Computational Sciences at George Mason University in Fairfax, VA, which has a well-supported Mac community. If you go to their college bookstore, you can get pretty much any Mac software at the academic price right on the spot, says Fleitz.

"They are VERY well-stocked for their art and visual media departments," she adds. "Also, I work at American University in Washington DC which has a great Mac community. Although the bookstore here is lacking in both PC and Mac software, Macs are well-supported between the publications department to their new media labs to the communications department and even the law school. It is a very Mac-friendly university."

Thats nothing...try outfitting an entire country of primary schools with net ready PC's...that happened here in NZ some time back.

Also, I'm getting sick of seeing iMacs on NZ TV screens...I was wondering why it was occuring...turns out Apple are the ones providing 'motivation' to local TV producers for maybe a few iMac appearances on national TV...

Aren't they just turning into a Micro$loth clone now huh?

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

I bought a G3 in December (not the new 'fancy' colured one) and equipped it with an internal Zip - I am now on my 3rd Zip drive, it has failed again, and my 4th 'motherboard' - Apple Canada are now 'thinkin' about replacing this large yellow ovoid filled with sour fruit !!!

Meanwhile my old Mega/STE keeps on, keeping on !!!

Progress huh ????

->Toronto District School Board buying a large number of iMacs is "nothing"
->compared to outfitting New Zealand's primary schools with net-ready PCs.

I think we should take that one step further, to be completely honest. It was already stated that 10,000 Macs were being bought. The population of Toronto is irrelevant, as is the population of NZ. What is pertinent is the number it took for the primary schools in NZ. Once you have that, a much fairer comparison can be made... ;-)

I can't really see why an Amiga user would want a PC mouse with an adapter
which performs doubleclicks with the middle button, when there are three-
buttoned Amiga mice which supply a real middle-button signal, which has
functions of its own on the Amiga, rather than just supplying a double-click.

This VGA adapter and IDE interface seem very interesting, though. Combined
with a 4 MB expansion, they'd make my ST seem like a really reasonable little
machine.

I wonder if these gadgets'd show up on NAS.

as an update - TiFKAS never showed up at the Flea Market. I think it might have to do with Ontario's rigid control over letting rabid animals across the border, and they spotted him foaming at the mouth.....

the key word here is convenience in finding a replacement mouse at a reasonable price - Mario heard that Amigans were having problems finding mice, so he added the option to allow for Amiga use (it's dip switch #4). Ken has already sold one mouse adaptor to an Amiga user here in Toronto who was in desperate need of a mouse, and we got some interest at the Flea Market from a few others.

BTW, I'm using a Mouse Adaptor right now with my Falcon and a Logitech 3-button serial mouse - that middle double click has come in handy. And Chris, our PHOENIX editor, is using a GlidePoint pad on his STe, as he finds its much more comfortable. You could also use a drawing tablet with it as well, or with one of the many PC trackballs.

>
>This VGA adapter and IDE interface seem very interesting, though. Combined

The VGA adapter has turned out to be the surprise hit of the entire range of products being made by Mario - according to Ken he's sold quite a few of them, including a number of US users. The IDE adaptor is a great feat of engineering, because not only is it a hard drive adaptor it's also a TOS upgrade (2.06). The STe version is also neat because it actually requires just one solder point, it plugs in over the original TOS chip.

>
>I wonder if these gadgets'd show up on NAS.

I think if there's a Scandanavian dealer it would be bound to show up. And wait till you see what Mario has coming next :)

Yes they will...These new technologies will drive the market....FW and FCP
will accelerate this market. If Apple left it alone to Avid the market would

stagnate due to cost....Even I am cut the bug...Getting the creative amatuers
hooked will drive the highend market in the future..

Do you think that Sam And Jack T still use their now defunct ST or do they use
an updated bad ass PC?

You're missing the point as usual. RIGHT NOW, FCP HAS ZERO IMPACT ON AVID SALES.
ZERO.
Everything else you say is just conjecture.. and conjecture from someone who is

NOT in the business. FCP is ideal only for people who SHOOT ON A DV FORMAT. MOST PROs DO NOT.

Granted, it doesn't take a brain surgeon to see that lowering the cost of entry increases the market.. but NOBODY knows how that will affect the PROFESSIONAL Avid market.

Most people who work on AVIDs have NO room for error.. they work under quick deadlines, they make a LOT of money, they need proven technology.. as close to bulletproof technology as possible. I can't even get the drivers for my ATI video card in my B&W G3 to load consistently.. and when it goes to sleep, one of the 2 internal SCSI drives doesn't wake up and requires a reboot. I'm NOT trusting time critical work to this system, and most professionals, for whom time is money, wouldn't either.

Merely anecdotal.. but the 2 people I know with Toasters still have them and haven't bought a non linear system. Again, it's just a guess.. your guess is from a person who has a vested interest in Apple.. my guess is someone who works on an AVID daily. Who would you trust?

So their announcement means.. what? Do you even KNOW why they dropped Mac?

Oh, childish Sinclar.. or TIFKAS, the nickname that I coined so long ago. I remember having a similar conversation with you about the Falcon and audio production YEARS AGO.. you weren't even familiar with Digidesign Pro Tools, the MOST COMMON PRO audio editing system in the world, yet you continued to babble on about audio production and which platforms were better..

Your problem is you don't know what the hell you are talking about in certain areas, but you continue to babble. Face it.. YOU KNOW NOTHING about video editing, YOU'VE NEVER actually worked on an AVID, you wouldn't know the difference between a Digital Betacam tape and a Beta SP tape if your life depended on it.. you are clueless.

I would NEVER even PRETEND to know all about Macs in general.. I mean, I have an 8600 running Pro Tools on my desk, and 9600 running Avid Xpress Mac and a B&W G3 400 in my editing room (not to mention a 9500/180 MP at home), all three of which I maintain.. but I wouldn't get into an argument about their operation with you, because you probably know more then me.

But you on the other hand.. you DON'T KNOW WHEN TO SHUT UP. You get in arguments with people and you obviously in over your head.. and you seem to be too dense to know it.

You DON'T KNOW the video market, dude.. talk about what you KNOW.

BTW, anytime you're in northern CA, you're welcome to come by my office and see whether I'm "for real" or not.

Hi there,

sinclair2246@my-dejanews.com wrote:

>
> Do you think that Sam And Jack T still use their now
> defunct ST or do they use an updated bad ass PC?

Probably not. Deep down in their hearts they may wish to still be using an ST. Who knows, they may even look at Bill Gates and think, 'Gee...if we'd done things just a little different we could be like him...and everyone would be using an Atari...', but then again they would look at Billy boy and realise that many many people really despise him for all he stands for...

They probably don't use ANY computer. Executive types are known computer illiterates...I've worked for a company where most of the senior level managers were complete dead losses on the PC's. It was upto a small number of low paid laboratory or admin staff to always be rescuing a hapless manager stuck on how to save the really neat 1 page Word document they had just spent 3 hours typing...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

They are to busy playing golf and having champagne lunches, too have the time to work out how to switch one on let alone use one. A pocket memo machine with it's 3 buttons is more up their street.

Joking aside, I went on a government course many moons ago, and there I watched a people were left sitting in front of computers and not even told how to switch them on!!!!

It wouldn't have been bad until you know that the personal managers got �50 GBP per week for every person they were suppose to be responsible for.

I ended up along with 3 other people, teaching the others, AND the Nimbus machines had no software available; or should I say the software was locked in a safe for ONE person's use, the company secretary who never used them anyway!!!!!

It's a crazy world.

Take out the 'ass' and what do we have? A friend who was silly enough
to buy a Celeron 366 recently got a Philips Windows CE palmheld. This
runs of a serial link (from modem port). He plugged the palmhelds wee
cable into the spare modem plug...and it worked fine!! But now his sound
card is not able to be used. Gee isn't Win98 a crock of shit! Thats why
I WILL NOT BUY A FREAKIN PC! Mac isn't too much better either...

Ok, so I'm a bit of a techie and know my way around computers but I just
haven't had many problems with my Win95 installation.
Going on two years without a reinstall (in fact I haven't had to do one
yet, touch wood) on the same system.

Sure, I've had the usual GPF's and complete system lockups that are
standard with Windows, and the multitasking is a pretty crap too, not to
mention the slowdowns when things get heavy.

All in all though, I think that a lot of problems arise from users lack of
knowledge and that other problems are extremely exaggerated by those who
hate Windows solely for the monopoly it represents.

Has anyone in this group had a reasonably good run with Windows, or am I
alone here?.

BTW, this isn't me advocating Wintel, far from it. It's just that only
today I realized how long I've been running without a serious crash and
it's got me curious...

Besides, things are a little quiet in this group ATM ;-)

Regards,

Clockmeister.

Well I'm using Windoze '98 and can only comment on 3.1 and '98. It's been 6 weeks since I've had to re-install everything and I've been struggling for 3 weeks. Another instal is due, and I'm awaiting delivery of NT hoping that that's better.

Things get slowed down when you turn the machine on!

>

Lack of knowledge!!! Well that rules me out then.....

>

I had a good run with 3.1/3.11 and wfw 3.11.

I have come to the following conclusion; the number after the 'P', e.g. p-120, p300 etc.. means the number of hours you can go without having to reinstall:)

The idea is that you upgrade to a faster machine BEFORE the time expires, and hence keep the manufacturers in a job.

BTW, why hasn't Intel released their 800 meg processor yet! it was supposed to have been ready in Oct '98 ready for a March '99 release, or they purposely holding back to call it a Pentium (TM) IV!!!

Techies (I'm half-pie one) may find getting a reliable system up and running on Win95/98 easier than non-techies. However, its the way that PC's are sold to the uninitiated that makes me laugh! These things are sold as reliable, easy to use tools that will really enhance your life in some way or another. Reality kicks in and sooner or later some system fuck-up occurs that requires a technician to fix. PC techs are becoming more common than PC retailers IMHO. M$ just keeps on laughing all the way to the bank...

> BTW, this isn't me advocating Wintel, far from it. It's just that only
> today I realized how long I've been running without a serious crash and
> it's got me curious...

Your situation is a rare one...professional IT managers at my former job couldn't even keep Win95 desktops running on an NT network without at least a few problems every day...

In conclusion Win95/98 are overly complicated beasts that really badly affect business/profitability in many organisations, who find themselves spending much time/$$$ on upkeep of systems rather than getting the work done...

> Besides, things are a little quiet in this group ATM ;-)

True. Disappointing really!

Apparently Sinplop has been unwell due to some excess 'palming'!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

A typical scenario. BTW, Win98 is just Win95 with WinExplorer tacked on
with blutak. Nothing new in Win98 makes me jump up and say 'Gee, this
Win98 thing really does improve on Win95!...'

> I have come to the following conclusion; the number after the 'P', e.g.
> p-120, p300 etc.. means the number of hours you can go without having to

I think you'll find its an inversely proportional equation. The model
shows that as the CPU gets faster, it takes less time to get to the
rogue system bug that hangs the machine, reorganises the FAT, and forces

a complete system re-install...

:)

The only time my Amiga has had a re-install was when I upgraded from 2.05
to 3.1. It didn't require formatting of the harddrive, that has never been
required for any reason.

Somewhere between RiscOS and MacOS, except with psuedo-multitasking thrown
in.

It is for a typical Windows installation it seems.

It's a little more then blutak I can assure you. Have you tried removing IE
from Win98?. But your point is a good one. IMO, Win98 should have been
released as a free service update/bugfix.
That would never happen ofcourse as that implies that Win98 is bug-free and
that is clearly not the case.

It's been much longer then 166 hours ;-)

He he. No GPF's on the Win95 - 386DX25 with 6Mb that I have here, but
admittedly it hasn't done anything usefull either.

Regards,

Clockmeister.

Well in the UK when you buy a machine you get a supplier, a warranty company and the now familiar premium , rip off phone numbers at 60p and upwards.

99% of problems when you get a new system are software ones; hey will give you a program setup in a certain fashion, if you want to know how to stop something happening or why are these printer programs for a printer, you don't own, doing here!!!! etc.. You'll have to pay a fortune to get software help,

The hardware side of things are pretty simple if you know what you're talking about. The chaps, or chapesses, at the end of the phone try and throw loads of excuses about details they know nothing about. Then they will pass you onto the technical department, probably the secretary on a tea break;), who tries to tell you or convince you that they know what they are talking about. These only know what they are taught by the company or what they read out of a book!!!

If people took a leaf out of the Atari users book, things wouldn't be so bad. And if ye olde Gates took some time, from counting his dosh, to find out what his OS actually does, or more importantly it doesn't, and produce an OS that isn't just thrown together any old how. If a �50 half mag Atari ST can do it why not create one for the humble PC owner that's also reliable!!! Even the ZX81 was more stable...

--
Cheers! for now

Lucky you !

I have never got a windows based computer to run stable
and have worked with win95 from the day it was released (and litle before)
both at work and at home.

Windows is a big bug !

>Sure, I've had the usual GPF's and complete system lockups that are
>standard with Windows, and the multitasking is a pretty crap too, not to
>mention the slowdowns when things get heavy.

So you have problems ... ?

>All in all though, I think that a lot of problems arise from users lack of
>knowledge and that other problems are extremely exaggerated by those who
>hate Windows solely for the monopoly it represents.
It can maybe be users lack of knowledge but there is infact big problems
to maintain the system when it is not working.
Click clik... wait ... reboot ... click .. reboot ... hang ...
- reinstall ..
- missing drivers ..
- bad drivers .. crash ...
- reinstall ...
It can take hours to get the computer running after a small crash
and i dont like this as it is a commercial product i have paid for.

You can for example install Solaris (commercial Unix) and it works very well and stable
and you can install linux (it is free) and this works very well too.
But not windows.

Every time i am going to use windows for a very simple task
it gives me more work with system maintance than the real task.

>Has anyone in this group had a reasonably good run with Windows, or am I

Hmm...okay, how many hardware and software changes have you made? Thats usually when the *fun* begins... ;-)))))

We use Windoze NT (*N*ot *T*rusted) on P233's at work. It sucks vacuum hard with a major slurp. The task bar sometimes responds to the mouse with a blank screen, for a few seconds before filling it in. My lowly Falcon does faster screen updates. ;-)

PS The OpenGL screen savers are okay...amusing for at least 10 mins!

LOL.
Not only that, it's a PS/2 and the HDD is running in MS-DOS compatibility
mode!
It did it to win a bet. BTW, when I installed it the 386 had only 4Mb RAM.
I added an extra 2Mb SIMM later.

>   PS Can you actually run any -other- software on it? ;^]

Given enough patience, it does run IE3.0 and MSword V6 (for WFW3.11
admittedly).
It does give the 120Mb HDD a bit of a thrashing though ;-)

For practical purposes, I use my P166 which performs (marginally?) better
or my Amiga ofcourse.

Regards,

Clockmeister.

Stability is and has always been a problem, but I've yet to re-install from
fresh.

Sure. Right at this moment, Windows seems to think that my modem isn't
connected (it's internal) and not working properly. (no conflicts)
It's been like that for ages, but as you are reading this it is pretty
obvious that my modem is working perfectly well. It seems Win95 is a little
confused...

Did I mention my Linux partition?. Drivers are a major headache...

In my case, the Windows seems to run fairly reliably most of the time but
then I have spent quite some time in the past debugging problems.

I mentioned my modem problem in a previous post and yes, I agree, hardware
changes do confuse Win95 and usually require some debugging.
Plug and Play is a load of crap.
I have changed modems, soundcards (that's a good one for headaches), video
cards, and a network card.

Yep. My Amiga is much faster updating screens then the P166 Win95 PC also.

You're right, but this newsgroup isn't exactly buzzing with Atari talk now
is it?.
Doesn't this create the perfect oppertunity to advocate Atari OS though?.

Spot on. The existence of this newsgroup is for Atari advocates to forward
the arguments they believe put their platform ahead of others. Supporters
of other computer platforms are allowed of course to debate the claims of
Atari users and add their arguments against the Atari users as well. As an
Atari advocate I welcome the likes of Peter Sinclair-Day into this newsgroup
because a bit of light-hearted banter between supporters of different machines
never did harm anyone. Its also quite amusing to read some responses too! :)

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

No brainer, indeed. Again, pros shoot on BETA SP, DIGITAL BETACAM, ETC, NOT

DV.You are so wrong as
to once again prove yourself a fool. Final Cut Pro is NOT anywhere near 80% of an Avid. On an Avid,
you have the choice of many different compression ratios, including near uncompressed video (not so
with FCP), a rock solid integrated system (not so with FCP), built in hardware accelerated 3d effects
(not so with FCP), component, pro inputs and pro balanced audio inputs and outputs (not so with FCP),
proven software that is SEVERAL generations old (not so with FCP), guaranteed performance of hardware
periferials (not so with FCP), a HUGE installed base with by far the largest market penetration (need
I say?).. etc etc..

Talk to me in a year or two when it's up a couple of revs, and you might be right.. maybe then FCP
will start to have an impact on Avid's sales. Now? You're proving your complete ignorance here.

Talk about WHAT YOU KNOW!

> > Granted, it doesn't take a brain surgeon to see that lowering the cost of entry increases the

> What do you not understand?

I don't understand what you said above.. it sounds to me like you're proving my point.. when people
who start out on FCP/Mac get "money/fees roll(ing) in" they will buy Avid? You're probably right..
how exactly does that negatively affect Avid's market?

> > > Are you for real...Or just pretending to be someone that you are not?

> Denial!

Hmm.. read what you just wrote about attacking the person? Er.. put, kettle?

Keep talking, you're proving my point for me.Once again, you refuse to comment on the bigger point.. which is, you DON'T KNOW the first thing about the video business. You wouldn't have posted the above if you had a clue. Only an idiot would contininue to defend himself in an argument where someone SO OBVIOUSLY knows MUCH MORE then he does. Then, to compound the mistake, the ONE point he makes in response is so CLEARLY demonstrative of his ignorance that I don't even really need to respond.

As far as "Atari Jihad," once again you are demonstrating your ignorance.. I don't care about what platform I use, unlike you. I use whatever tool helps me get my work done most efficiently. I do most of my work on my Mac system at home.. I do a lot of work on Macs and Windows systems at work, but more Mac then Windows for audio and video work.

I don't blame you for trying to insult me, though.. you don't have the knowledge to actually debate with me about pro audio and video.

Again, talk about what you KNOW!!

> > Your problem is you don't know what the hell you are talking about in certain areas, but you

What Video workstation have you done work on? What formats?
Talk about what you know...

Maybe anorak wearers would get pleasure from such a device
but I don't think I ever would because...

1. I don't have a USB port on my Falcon030...

2. My girlfriend would kill me!! ;^)

I could use it as an interesting ornament to sit on the
coffee table perhaps...a conversation piece? :)

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

First, it's time once again for the annual TAF Executive Elections! If you like what the club is doing, or want to see a change in how it's being run, then by all means come in and let your voice be heard! This is the executive you'll be bringing in to the next millenium....

Then, we'll be looking at how to improve the efficiency of your PC computer - by installing an Atari emulator and running your favorite ST applications on it! We'll be looking at GEMulator, TOSBox, PacifiST and other popular ST emulators, running on both a PC laptop and on our PHOENIX editor's PC tower! Learn about how well the various emulators run, the advantages, the pitfalls, the issues on emulation - and what does and doesn't run. Needless to say, this seminar will also allow you to run your programs well into the millenium as well.

It'll be an exciting night, to say the least. See you there!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

Hello all,

I have made the plunge into my newly acquired 800XL and want to learn to program on it and I have a VERY embarrassing question.

How to I save and load from my 1050 floppy drive?

I have a book on game programming that came with a disk. I typed CLOAD and it started to load, but then I realized that there are most likely more than 1 program on the disk. The disk isn't labeled so I need to know what is on it. How do I find out the names of the files on the disk and how do I load those files (I assume CLOAD then the name of the program)? I assume saving a program is similar.

I am too used to DOS and Windows...

Please e-mail me at delliott@nac.net and don't be too hard on me.

Thanks,
David

PS I'm sure the same holds true for my 410 program recorder too...

The commands in ATARI BASIC is as follows:

LOAD "D:FILENAME.BAS" - D is for disk drive, if you have more than one
disk drive then you can use LOAD "D2:FILENAME.BAS" this will load the
program FILENAME.BAS from the second disk drive.

To save a file it is pretty much the same SAVE "D:FILENAME.BAS" etc..

You can also load then run a file by RUN "D:FILENAME.BAS"

By typing DOS you can get a menu of DOS options.

Filenames have the same rules as MS-DOS on a PC, including wildcards.

Disk directory can only be seen by going into the DOS menu and
selecting A.

Hope this answers you questions.
